

# DXC-730P

## SERVICE MANUAL

The DXC-730P is the same as the 3CCD Video Camera DXC-750P except the items specified in the Difference Chart.

*Varh.*

This manual covers only different portions, so please use this manual together with the service manual for the DXC-750P.

### Difference Chart

## SERVICE MANUAL

REVISED-1

TGR-750

3CCD Video Camera  
Title Generator

**SONY**®

## CAUTION

A CERTIFIED PLUG RATED 250 V, 6A OR MORE FOR CLASS I EQUIPMENT  
MUST BE ATTACHED TO THE END OF THE POWER CORD.

## WARNING

When connecting an external unit to the CONTROL IN connector of the control unit and the CONTROL connector of the camera head, the connecting cable to be connected to these connectors must be shielded as follows to prevent radio interference the shield braid must be properly bonded to the outer shell of the connector.

## VORSICHT

Wenn Sie ein externes Gerät an die CONTROL IN-Buchse des Steuereinheit und die CONTROL-Buchse des Kamerakopfes anschließen, achten Sie darauf, daß das Verbindungskabel, das zum Anschluß an diese Buchsen verwendet wird, folgendermaßen abgeschirmt ist, da es sonst zu Interferenzen kommen kann. Die Umklöppelung muß an der äußeren Hülle der Buchse fest anhaften.

# CHAPTER 1

## OPERATION

### 1-1. OUTLINE

The DXC-750P is a color video camera which uses a CCD (Charge Coupled Device) solid state image sensor having 450,000 effective picture elements.

Thanks to small-size and light-weight, the camera head can be connected to an operation microscope or an endoscope to reproduce the details of an object in high quality. Precise adjustments of picture quality according to the shooting conditions can be remotely controlled by a multi function camera control unit.

The DXC-750P has the following features.

#### Light-weight and high quality camera head adopting a CCD having 450,000 picture elements

- Small-size, light weight and lower power consumption.
- Low lag, high resistance to image burning and no deflection distortion.
- Thanks to the high signal-to-noise ratio, the video gain can be increased, which makes it possible to shoot a picture under low light conditions.

#### Various adjusting functions

- Various adjusting functions such as automatic or manual black balance, white balance and iris adjustment, selection of video output level, pedestal level adjustment, allow the precise adjustment of picture quality.
- Gamma correction circuit and linear matrix circuit can be cut off to obtain a signal without correction. The signal is used for processing or measuring a picture with a computer.

#### Multiple output signals

- Four kinds of video output signals—composite video signal (VBS), component video signals, Y/C signal and RGB signals—are available so that the camera can supply a high quality picture to the various kinds of signal format system.
- A clock signal synchronized with the CCD driving clock can be output. When the clock in a computer is synchronized with this clock, a picture can be processed or measured in the unit of a picture element.

#### Gen-lock function

The camera can be locked with an external reference signal. When two or more cameras are used or when a camera is connected to the picture processing equipment, the camera and other equipment can be synchronized with a reference signal.

#### Electronic shutter

Electronic shutter with 7 steps of the speed from 1/125 to 1/10000 second enables the camera to produce clear images in still or slow-motion playback even when the objects are moving at very high speeds.

#### Title display

With the supplied title generator, characters of alphabets or figures or time can be superimposed on a picture picked up by a camera. It is also possible to superimpose a picture generated by an external title generator on a camera picture.

## 1-2. LOCATION AND FUNCTION OF PARTS

### Camera Head

- 1 Lens mount clamp ring** (bayonet type) (P 1-10)  
Attach a lens with a bayonet type mount (optional) or an adaptor for a microscope (optional).
- 2 CONTROL connector** (4-pin)  
An external control signal is input through the CONTROL IN connector on the camera control unit to control the camera head. The control signal input to the camera head is directly output from this connector.  
The control function and signal are not specified. Please consult your Sony dealer.
- 3 LENS connector** (6-pin) (P 1-10)  
Connect a cable of the lens.
- 4 MONITOR connector** (BNC type)  
A monochrome video signal picked up by the camera is output. Connect to the video input connector of a video monitor to check the position of an object.
- 5 Connecting cable** (with a 26-pin connector) (P 1-11)  
Connect to the CAMERA HEAD connector on the camera control unit.

### Camera Control Unit — front

- 1 IRIS AUTO/MANUAL indicators** (P 1-19)  
Show the setting of the IRIS AUTO/MAN selector **16**.  
**AUTO** (green) is lit: The iris is automatically adjusted to the optimum value according to the video level input from the camera head.  
**MANUAL** (orange) is lit: The iris is manually adjusted with the IRIS control **15**.
- 2 GAIN indicators** (P 1-20)  
Show the setting of the GAIN selector **14**.  
The 0 dB indicator lights in green, and the 9 dB and 18 dB indicators light in orange.
- 3 LOW LIGHT indicator** (P 1-17)  
Lights in orange when a video signal level from the camera head is too low and the brightness of a picture is insufficient.  
Adjust the iris when it is adjusted manually, or increase the video output level with the GAIN selector **14**.
- 4 COLOR TEMP (temperature) indicators** (P 1-16)  
Show the setting of the COLOR TEMP selector **13**.  
**3200K** (green) is lit: Color temperature for indoor shooting is selected.  
**5600K** (green) is lit: Color temperature for outdoor shooting is selected.
- 5 SHUTTER ON/OFF indicators** (P 1-22)  
Show the setting of the SHUTTER ON/OFF switch **23**.  
**OFF** (green) is lit: The electronic shutter is not used.  
**ON** (orange) is lit: Shutter speed can be selected with the SHUTTER speed selector **24**.

#### 6 Cover panel

Pull the right side of the indication PULL OPEN, and the cover panel opens.  
The panel can be stored in the unit by pushing it horizontally.

#### 7 VIDEO OUT connector (P 1-12)

A composite video signal picked up by the camera is output. The same signal is also output from the VIDEO OUT connectors (VBS1 and VBS2) on the rear panel.

#### 8 TITLE connector (P 1-11)

Connect the supplied title generator. Title can be superimposed on the video signal.

#### 9 CONTROL IN connector

To control the camera head with equipment connected, input the control signal here. The signal is input to the camera head through the connecting cable.  
The function and signal for controlling the camera head are not specified. For details, please consult your Sony dealer.

#### 10 POWER switch (P 1-16)

Set to ON to supply the power to the camera control unit, camera head, lens and supplied title generator.

#### 11 W/B (white/black) BALANCE AUTO/MANUAL indicators (P 1-18)

Show the setting of the W/B BALANCE AUTO/MAN selector 19.

**AUTO** (green) is lit: White balance and black balance can be automatically adjusted.

**MANUAL** (orange) is lit: White balance and black balance can be manually adjusted.

#### 12 WHITE/BLACK buttons and indicator (P 1-16)

To adjust the white balance or black balance automatically, set the W/B BALANCE AUTO/MAN selector 19 to AUTO, and press the WHITE or BLACK button.

When the adjustment completes, the indicator lights. If the adjustment cannot be completed, the indicator blinks.

## Camera Control Unit — inside the cover panel

### 13 COLOR TEMP (temperature) selector (P 1-16)

Set according to the lighting conditions.

**3200K:** For indoor shooting

**5600K:** For outdoor shooting

### 14 GAIN selector (P 1-20)

If sufficient brightness cannot be obtained because of the lighting conditions, the output video signal level can be increased with this selector.

The gain can be switched to three steps, 0 dB, 9 dB or 18 dB. For shooting under normal conditions, set the selector to 0 dB.

### 15 IRIS control (P 1-19)

Adjusts the iris manually. For manual iris adjustment, set the IRIS switch on the lens to A (automatic), and the IRIS AUTO/MAN selector **16** to MAN.

When the IRIS AUTO/MAN selector is set to AUTO, fine adjustment of iris is possible within the range of half step.

### 16 IRIS AUTO/MAN selector (P 1-19)

Selects whether the iris is adjusted automatically or manually.

**AUTO:** The lens iris is automatically adjusted according to the brightness of the object.

**MAN:** The lens iris is manually adjusted with the IRIS control **15**.

This selector is activated only when the IRIS switch on the lens is set to A (automatic).

### 17 MODE selector (P 1-16)

Selects the output video signal of the camera control unit.

**CAM:** The video signal picked up by the camera is output.

**BARS:** Color bar signal used for adjusting the monitor is output.

### 18 DETAIL control (P 1-20)

Adjusts the contours of objects.

### 19 W/B (white/black) BALANCE AUTO/MAN selector (P 1-8)

Selects whether the white balance and black balance are adjusted automatically or manually.

**AUTO:** White balance and black balance can be automatically adjusted.

**MAN:** White balance and black balance can be manually adjusted.

### 20 W/B BALANCE R/B GAIN (red and blue level of white balance adjustment) controls (P 1-18)

Used for white balance adjustment. The level of the R (red) component and the B (blue) component of the signal can be adjusted. These controls are activated only when the W/B BALANCE AUTO/MAN selector **19** is set to MAN.

### 21 W/B BALANCE R/B PED (red and blue pedestal level of black balance adjustment) controls (P 1-18)

Used for black balance adjustment. The pedestal level of the R (red) component and the B (blue) component of the signal can be adjusted. These controls are activated only when the W/B BALANCE AUTO/MAN selector **19** is set to MAN.

**[22] MASTER PED (pedestal level) control (P 1-20)**

Adjusts the pedestal level of the R, G and B components of the output signal simultaneously.

**[23] SHUTTER ON/OFF switch (P 1-22)**

When the electronic shutter is used, set the switch to ON; when the shutter is not used, set to OFF.

**[24] SHUTTER speed selector (P 1-22)**

Selects the shutter speed with the SHUTTER ON/OFF switch [23] set to ON.

Seven speeds (1/125, 1/250, 1/500, 1/1000, 1/2000, 1/4000 or 1/10000 seconds) are available.

**[25] SC (subcarrier) PHASE selector and control (P 1-21)**

To operate the camera synchronizing with the VBS or HD/VD signals, adjust the subcarrier phase difference between the external sync signal and the camera output signal.

Set the selector to either 0° or 180°, then turn the control for fine adjustment.

**[26] H PHASE (horizontal phase) control (P 1-21)**

To operate the camera with the sync system using VBS or HD/VD signal, adjust the horizontal sync phase difference between the external sync signal and the camera output signal.

## Camera Control Unit — rear

**1 VIDEO OUT connectors: VBS1, VBS2 (BNC type) (P 1-12)**

A picture picked up by the camera is output as the composite video signal (VBS: Video, Burst, Sync) from these connectors. The same signals are output from these connectors and the VIDEO OUT connector on the front panel. Connect to the composite video input connector on a video monitor or VTR.

**2 RGB1 output connectors: R, G, B (BNC type) (P 1-13)**

A picture picked up by the camera is output as the R, G and B signals. Connect to the R, G and B input connectors on a monitor, VTR, computer, etc.

**3 RGB2/COMPONENT output connectors: R/R-Y, G/Y, B/B-Y (BNC type) (P 1-12, 1-13)**

A picture picked up by the camera is output from these connectors as the R, G and B signals or the component signals (Y, R-Y, B-Y) selected by the RGB2/COMPONENT selector **5**. The R, G and B signals output here are the same signals as those output from the RGB1 connectors.

**4 RGB SYNC ON/OFF switch (P 1-13)**

To add the sync signal to the R, G and B signals output from the RGB1 and RGB2 connectors, set the switch to ON. Not to add the signal, set the switch to OFF.

**5 RGB2/COMPONENT selector (P 1-12, 1-13)**

Select the output signal from the RGB2/COMPONENT connectors **3**.

**6 OUTPUT: COMPOSITE SYNC connector (BNC type) (P 1-13)**

A composite sync signal is output. To synchronize the external equipment such as a video monitor with this unit, connect to the sync input connector of the equipment.

**7 OUTPUT: CLOCK connector (BNC type)**

A clock signal (14 MHz) synchronized with the CCD driving clock is output. Connect to the clock input connector on a computer which can be synchronized with an external clock, and terminate the clock signal in 75 ohms. Then the computer can be operated synchronizing with the clock of this unit.

Connect this connector when a picture picked up by the camera is processed in the unit of a picture element.

**8 OUTPUT: HD connector (BNC type)**

To synchronize the external equipment with this unit in the sync system using the HD/VD signal, connect to the HD signal input connector of the equipment.

**9 OUTPUT: VD connector (BNC type)**

To synchronize the external equipment with this unit in the sync system using the HD/VD signal, connect to the VD signal input connector of the equipment.

**10 GENLOCK IN: VBS connectors (BNC type) and 75-ohm termination switch (P 1-14)**

To operate this unit in an external sync system using the VBS signal, input the reference sync signal (VBS or black burst) to one of these connectors.

The input reference sync signal is directly output from the other connector. When the output signal is supplied to other equipment, set the 75-ohm termination switch to OFF. When the output signal is not used, set the switch to ON.

**[11] GENLOCK IN: HD connectors (BNC type) and 75-ohm termination switch (P 1-15)**

To operate this unit in an external sync system using the HD/VD signals, input the HD signal to one of these connectors.

The input HD signal is directly output from the other connector. When the output signal is supplied to other equipment, set the 75-ohm termination switch to OFF. When the output signal is not used, set the switch to ON.

**[12] GENLOCK IN: VD connectors (BNC type) and 75-ohm termination switch (P 1-15)**

To operate this unit in an external sync system using the HD/VD signals, input the VD signal to one of these connectors.

The input VD signal is directly output from the other connector. When the output signal is supplied to other equipment, set the 75-ohm termination switch to OFF. When the output signal is not used, set the switch to ON.

**[13] Y/C OUT connector (mini DIN 4-pin) (P 1-13)**

A picture picked up by the camera is output as the Y/C signal (luminance signal/chrominance signal). Connect to the Y/C signal input connector on a video monitor or VTR of ED Beta\* format or S-VHS\*\* format.

**[14] LINEAR MATRIX ON/OFF switch (P 1-22)**

The linear matrix circuit (which reproduces life-like color with the matrix processing) is turned ON and OFF. Normally set to ON. If the signal without linear matrix processing is required for a picture processing, set the switch to OFF.

**[15] GAMMA ON/OFF switch (P 1-21)**

Gamma correction circuit (which compensates the luminance characteristics of the cathode ray tube by increasing the output level of the input signal with lower luminance) is turned ON and OFF.

**ON:** Gamma value is set to 0.45. Normally set to this position.

**OFF:** Gamma value is set to 1 (no gamma correction).

When a picture without gamma correction is required, set to this position.

**[16] AUX IN connector (BNC type)**

Input the monochrome signal such as title, figures, made by the external equipment, and the picture is superimposed on the picture picked up by the camera. Input the signal which does not include sync signal, and adjust its level so that the level of the signal output from the camera control unit does not exceed the designated amount.

To synchronize the external equipment with this unit, connect the OUTPUT: HD connector [8]/VD connector [9] or the OUTPUT: COMPOSITE SYNC connector [6] to the corresponding input connector of the external equipment.

**[17] CAMERA HEAD connector (P 1-11)**

Connect the cable from the camera head or an extension camera cable (optional).

**[18] CABLE COMP (compensation) selector (P 1-11)**

Set this selector according to the length of the camera cable being used (10, 25, 50 or 100 m). The built-in cable compensator performs compensation according to the selected cable length to eliminate signal degradation.

**[19] AC IN connector (P 1-11)**

Connect the supplied AC power cord.

\* ED Beta is a trademark of Sony Corporation.

\*\* S-VHS is a trademark of Victor Company of Japan, Limited.

### 1-3. EXAMPLES OF SYSTEM CONFIGURATION

#### Combination with a Microscope or an Endoscope

To connect a microscope, operation microscope or endoscope to the camera head, an optional adaptor is necessary.

#### When Multiple Cameras Are Used (external sync with the VBS signal)

## Combination with Picture Processing Equipment (external sync with the HD/VD signals)

# 1-4. CONNECTIONS

## Attaching a Lens or a Microscope Adaptor

A lens with bayonet mount can be attached to the camera.

To mount a microscope, operation microscope or endoscope to the camera, an adaptor for a microscope, operation microscope or endoscope should be mounted to the camera head. The adaptor can be attached to the camera head with the same method as of the lens.

**1** Turn the mount clamp ring fully counterclockwise. (If a cap is attached to the mount section, remove it.)

**2** Align and insert the lens into the lens mount.

**3** Turn the mount clamp ring clockwise, and tighten it firmly.

**4** Connect the lens connector to the LENS connector on the camera head.

## Connecting the Camera Head

### Using an extension cable (optional)

- Set the CABLE COMP selector to 10, 25, 50 or 100 m according to the total length of the used cables. The cable compensation circuit compensates the transmission loss of high-frequency components and the output level decreases.

### Attaching the camera head to a tripod

The camera head can be attached to a tripod using either of the screw holes (U1/4"-20UNC) on its top and bottom.

## Connecting the Title Generator

## Connecting a Video Monitor and a VTR

### Connecting the equipment with the composite video input connector

The same composite video signals are output from the VIDEO OUT connector on the front panel and the VIDEO OUT VBS1 and VBS2 connectors on the rear panel of the camera control unit.

### Connecting a VTR with the component input connectors

To supply the component signals from the RGB2/COMPONENT connectors, set the RGB2/COMPONENT selector to COMPONENT.

### Connecting the equipment with the R, G and B input connectors

To supply the R, G and B signals from the RGB2/COMPONENT connectors, set the RGB2/COMPONENT selector to RGB2. Then the same signals are output from the RGB1 and RGB2/COMPONENT connectors.

#### \* To synchronize the RGB monitor with the camera

To synchronize the monitor with the composite sync signal, connect the COMPOSITE SYNC connector to the sync signal input connector on the monitor and set the RGB SYNC switch to OFF.

When using a monitor which can be synchronized with the sync signal added to the RGB signals, set the RGB SYNC switch on the camera control unit to ON. The sync signal is added to the RGB signals output from the camera. In this case, connection of the COMPOSITE SYNC connector is unnecessary.

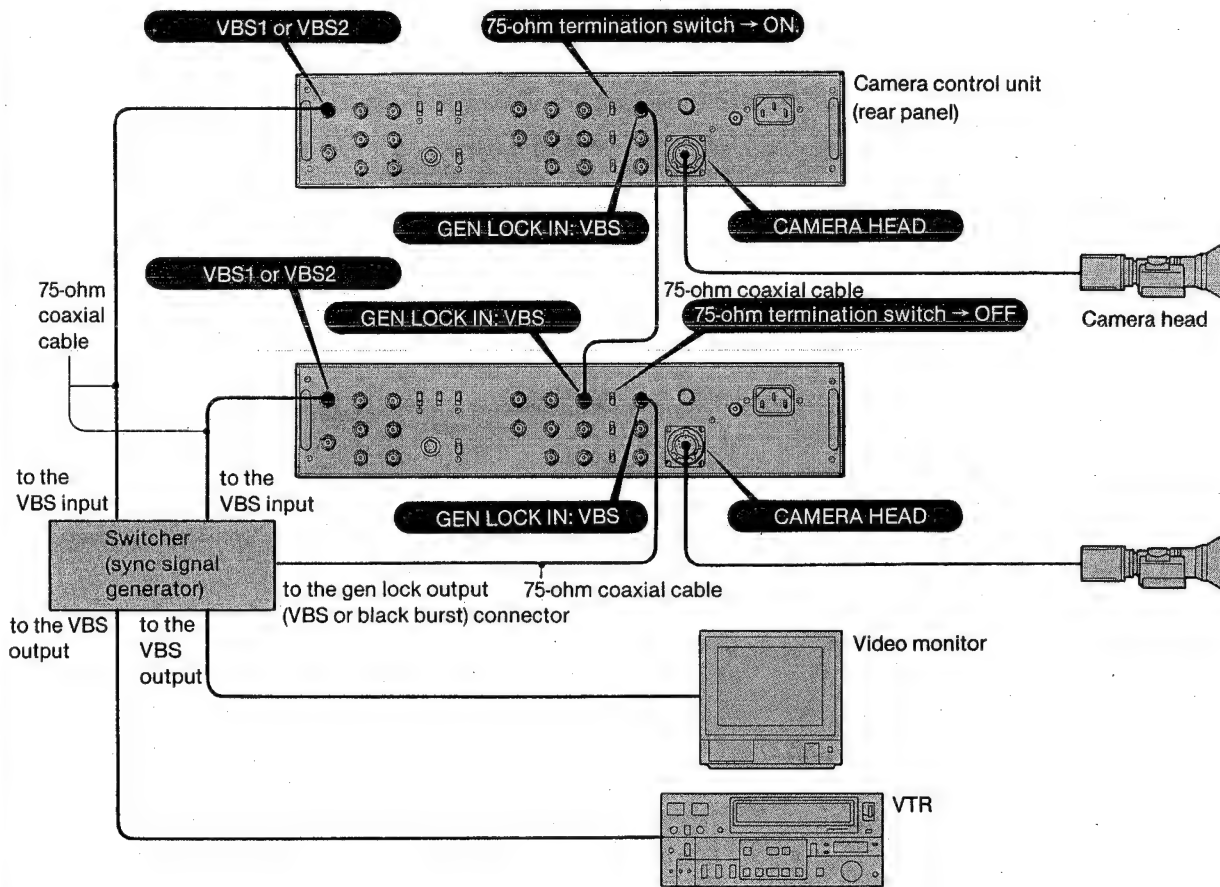

### Connecting the equipment with the Y/C input connector

## Connecting Multiple Cameras (external sync with the VBS signal)

When two or more cameras are used by selecting their pictures with a switcher, all cameras should be connected so that they are synchronized with the same sync signal.

### GEN LOCK IN connector

A reference sync signal input to one of the two GENLOCK IN: VBS connectors on the camera control unit is directly output from the other connector. Input the signal output from the GENLOCK IN: VBS connector to the GENLOCK IN: VBS connector on another camera control unit, and that camera is synchronized with the same reference signal. By connecting the GENLOCK IN: VBS connectors in this way, all cameras can be synchronized with the reference signal.

### 75-ohm termination switch

To supply the signal input to one of the GENLOCK IN: VBS connectors from another GENLOCK IN connector to other equipment, set the 75-ohm termination switch to OFF. Not to supply it, set the switch to ON.

## Connecting the Picture Processing Equipment (external sync with the HD/VD signals)

### GEN LOCK IN connector

HD and VD signals input to either of the two GNELOCK IN: HD and VD connectors on the camera control unit are directly output from the other connectors. Input the signals output from the GENLOCK IN: HD and VD connectors to the HD input and VD input connectors on another equipment, and it is synchronized with the HD/VD signals.

### 75-ohm termination switch

To supply the signal input to either of the GENLOCK IN: HD and VD connectors from the other connectors to other equipment, set the 75-ohm termination switches to OFF. Not to supply them, set the switches to ON.

## 1-5. BASIC OPERATION

Standard settings and basic operation for using a camera is described here.

When the camera control unit is set to the standard condition, the iris, black balance and white balance are automatically adjusted, and a good quality picture can be obtained under the normal lighting conditions without fine adjustments.

- 1** Turn on the power of the camera control unit and the equipment connected.
- 2** Set the IRIS switch on the lens (or the microscope adaptor, etc.) to A (automatic).  
The iris can be adjusted with the camera control unit.
- 3** Adjust the lighting conditions and the camera angle.
- 4** Check that all the indicators on the front panel of the camera control unit are lit in green. (standard settings)  
If an indicator is lit in orange, set the corresponding selector inside the cover panel to the horizontal position. The horizontal position (orange part disappears) of all switches is the standard setting position.  
When the LOW LIGHT indicator is lit, refer to note 2.
- 5** Set the COLOR TEMP selector according to the lighting conditions.  
Indoor shooting: 3200K  
Outdoor shooting: 5600K  
If lighting is too bright in case of outdoor shooting, use the supplied ND filter.
- 6** Adjust the color of the video monitor using the color bar signals as follows:  
(1) Set the MODE selector to BARS.  
(2) Adjust the color and hue controls on the monitor observing the color bars.  
(3) After adjustment, set the MODE selector to CAM.
- 7** Adjust the black balance and white balance as follows (automatic adjustment):  
(1) Press the BLACK button.  
Black balance is adjusted, and the indicator lights when the adjustment is completed.  
If the indicator blinks, refer to note 3.  
(2) Place a white subject (white paper, cloth, etc.) near the subject to be shot actually, and display it at the center of the monitor screen.  
(3) Press the WHITE button.  
White balance is adjusted, and the indicator lights when the adjustment is completed. If the indicator blinks, refer to note 4.
- 8** Start shooting.

## Notes

### 1) When multiple cameras are used

After step 4 (standard settings complete), adjust the H phase and SC phase of all the cameras. (Refer to "Adjusting the SC and H phases".)

### 2) When the LOW LIGHT indicator is lit

The lighting is not sufficient.

Increase the brightness by using appropriate lighting, or increase the video output level. (Refer to "Adjusting the Video Output Level".)

When the iris is manually adjusted, open it so that sufficient brightness is obtained before taking the above measures. (Refer to "Adjusting the Iris".)

### 3) If the indicator blinks when the BLACK button is pressed

The automatic black balance adjustment cannot be completed. Check the followings and press the BLACK button again.

- The lens cable is properly connected to the camera head.
- Iris is closed (when the iris is manually adjusted).
- Cut off the light (when the equipment without an iris control function is connected to the camera head).

### 4) If the indicator blinks when the WHITE button is pressed

The automatic white balance adjustment cannot be completed. Check the followings and press the WHITE button again.

- When the LOW LIGHT indicator is lit, refer to note 2, and take the necessary measures.
- When the LOW LIGHT indicator is not lit, check if the COLOR TEMP selector is set in accordance with the lighting conditions.

### 5) When the lighting condition is changed

Adjust the white balance again. Black balance adjustment is not necessary. The adjusted values of white balance and black balance are kept intact for about 12 hours even when the power is turned off. Therefore readjustment is not necessary when shooting under the same lighting conditions again.

## 1-6. ADJUSTMENTS

### Adjusting Black Balance and White Balance Manually

The black balance and white balance should be correctly adjusted to obtain lifelike color reproduction and a clear picture. Usually adjust them automatically. (Refer to "Basic Operation".)  
For fine adjustment, adjust them manually. For manual adjustment, use of a waveform monitor and a vectorscope is recommended.

- 1** Set the same lighting condition as that under which the shooting will be made.
- 2** Set the W/B BALANCE AUTO/MAN selector to MAN.
- 3** Set the IRIS AUTO/MAN selector to MAN, and turn the IRIS control fully counterclockwise to close the iris.
- 4** Turn the W/B BALANCE PED: R and B controls to adjust the pedestal level of R (red) and B (blue) components so that the monitor screen becomes black.
- 5** Set the IRIS AUTO/MAN selector to AUTO.
- 6** Place a white subject at the same position as the subject to be shot actually, and shoot and display it on the monitor screen.
- 7** Turn the W/B BALANCE GAIN: R and B controls to adjust the level of R (red) and B (blue) components so that the white subject on the monitor screen is pure white.

#### Painting

Using the GAIN and PED controls, a picture can be colored to obtain special effects. For example, a picture can be made that the desired color is obtained.

## Adjusting the Iris

The iris of the lens or the microscope adaptor can be controlled by the camera control unit. The standard setting is the automatic adjustment which obtains the optimum picture brightness. For a picture with special effects or shooting a picture with high contrast, manual adjustment is recommended for better quality picture.

### Automatic adjustment

- 1** Set the IRIS selector on the lens or the microscope adaptor to A (automatic).
- 2** Set the IRIS AUTO/MAN selector on the camera control unit to AUTO  
The iris will be automatically adjusted according to the brightness of the subject.  
You can precisely adjust the iris within the range of half step in the automatic iris mode by turning the IRIS control.

### Manual adjustment

- 1** Set the IRIS switch on the lens to A (automatic).
- 2** Set the IRIS AUTO/MAN selector on the control unit to MAN.
- 3** Turn the IRIS control to adjust the iris so that the optimum brightness is obtained.

## Adjusting the Video Output Level

When lighting is insufficient, the LOW LIGHT indicator lights. If sufficient brightness cannot be obtained by opening the iris, the video output level is increased by the GAIN selector.

**Set the GAIN selector to the appropriate position so that the optimum brightness is obtained.**

### Setting of the GAIN selector

0 dB: Normally set to this position.

9 dB: The output video level will be increased by 9 dB.

18 dB: The output video level will be increased by 18 dB.

## Adjusting the Master Pedestal Level

When the details of the dark parts of a picture cannot be reproduced clearly, adjust the master pedestal level with the MASTER PED control.

**Turn the MASTER PED control so that the detail of the dark part such as black hairs is reproduced clearly.** When a waveform monitor is used, you can adjust the level easily.

Normally set the control to the center position.

## Adjusting the Details

The contours of a picture can be changed by the DETAIL control. Turn the control clockwise, and the contours will become clearer.

**Adjust the contours from soft to clear as desired.** Normally set the control to the center position.

## Adjusting the SC and H Phases

When two or more cameras are used, all cameras should be adjusted so that the picture tone of all cameras will be the same. Supply the same reference signal to all the cameras, and proceed as follows. (Refer to "Connecting the Multiple Cameras".)

### If the phase check indication is available

If the cameras are connected to a special effects generator or a chroma keyer which has the phase check indication, adjust the SC and H phases as follows.

- 1** Set the PHASE INDICATION switch of the connected special effects generator or the chroma keyer to ON.
- 2** Adjust the H (horizontal) phase by turning the H PHASE control.
- 3** Adjust the SC (subcarrier) phase. Set the SC PHASE selector to 0° or 180° for coarse adjustment, and turn the SC PHASE control for fine adjustment.

For details, refer to the instruction manual of the special effects generator or chroma keyer.

### If the phase check indication is not available

Pick one camera as the reference camera and adjust all other cameras to it.

#### Adjusting the H phase

Adjust the horizontal sync signal of the output signal by turning the H PHASE control so that the phase of the reference signal and output signal become the same. Use of a waveform monitor or an oscilloscope is recommended for easier adjustment.

#### Adjusting the SC phase

Adjust the subcarrier phase of the output signal with the SC PHASE selector and control so that the phases of the reference signal and output signal become the same. It is recommended to use a vectorscope, or to display the same pictures on the upper and lower (or right and left) halves of the video monitor screen by using the wipe function of the special effects generator for easier adjustment.

## Gamma Correction

Camera control unit (rear panel)

GAMMA ON/OFF switch

To obtain lifelike color reproduction of the dark parts of the picture by compensating the luminance characteristics of the cathode ray tube against the input signal level, the input signal from the camera head is compensated (gamma correction).

**Normally set the GAMMA ON/OFF switch to ON.**

A gamma value of 0.45 is obtained from the camera head output signal.

**If a signal with no gamma correction is required, set the GAMMA ON/OFF switch to OFF, and the gamma value will be 1.**

## Linear Matrix Processing

Camera control unit (rear panel)

LINEAR MATRIX ON/OFF switch

To obtain optimum color reproduction, matrix processing of color signals is executed (linear matrix). **Normally set the LINEAR MATRIX ON/OFF switch to ON**, and the linear matrix processing will be executed.

**If a signal with no linear matrix processing is required, set the LINEAR MATRIX ON/OFF switch to OFF.**

## Selecting the Shutter Speed

SHUTTER ON/OFF switch

SHUTTER speed selector

To obtain a clear image of a subject moving at high speed, to obtain a strobe effect, or to reproduce a still picture, slow motion clearly, etc., use the electronic shutter.

**Normally set the SHUTTER ON/OFF switch to OFF (standard setting).**

**To use the electronic shutter, set the SHUTTER ON/OFF switch to ON, then select the appropriate shutter speed with the SHUTTER speed selector.** Seven speeds of 1/125, 1/250, 1/500, 1/1000, 1/2000, 1/4000 and 1/10000 seconds are available.

## 1-7. RACK MOUNTING

When the rack mount brackets (supplied) are attached to the control unit, the unit can be mounted in a 19-inch standard rack.

### Note

Avoid mounting multiple control units stacked. Air circulation may be insufficient, and malfunction or error may occur.

## 1-8. SPECIFICATIONS

Image device	Interline-transfer CCD, 3-chip
Picture elements	786 × 581 (h/v)
Sensing area	8.8 mm × 6.6 mm (equivalent to a 2/3-inch pickup tube)
Sync system	Internal
	External (VBS, HD/VD)
Signal system	CCIR standards, PAL color system
Scanning system	625 lines, 2:1 interlace
Scanning frequency	Horizontal: 15.625 kHz Vertical: 50 Hz
Horizontal resolution	700 lines (center)
Sensitivity	2,000 lux with F5, at 3200K
Minimum illumination	25 lux with F1.4, +18 dB
Signal-to-noise ratio	58 dB
Lens mount	Bayonet mount
Shutter speed	1/125, 1/250, 1/500, 1/1000, 1/2000, 1/4000 and 1/10000 second
Camera cable extension	100 m in maximum
Video output	0 dB, 9 dB, 18 dB
Detail compensation	Manual
Linear matrix	ON/OFF
Gamma	1 or 0.45 (selectable)
Black balance and white balance adjustment	Automatic
	Manual: R and B (gain and pedestal)
Input and output connectors	
	Camera head
	LENS (6-pin) ×1
	MONITOR (BNC-type) ×1
	CONTROL (4-pin) ×1
	Ground ×1
	Camera control unit
	VIDEO OUT (on the front) (BNC-type) ×1
	VBS 1.0 Vp-p, 75 ohms
	VIDEO OUT: VBS1, 2 (on the rear)
	(BNC-type) ×1 in each
	VBS 1.0 Vp-p, 75 ohms
	RGB1: R, G, B (BNC-type) ×1 in each
	0.7 Vp-p, 75 ohms
	RGB2/COMPONENT (selectable)
	R/Y, G/Y, B/B-Y (BNC-type) ×1 in each
	R, G, B 0.7 Vp-p, 75 ohms
	R-Y 0.7 Vp-p
	Y 1.0 Vp-p
	B-Y 0.7 Vp-p
	75 ohms
	Y/C OUT (mini DIN 4-pin) ×1
	1.0 Vp-p, 75 ohms
	OUTPUT:
	COMPOSITE SYNC (BNC-type) ×1
	4 Vp-p, 75 ohms
	HD, VD (BNC-type) ×1 in each
	4 Vp-p, 75 ohms
	CLOCK (BNC-type) ×1
	2 Vp-p, 75 ohms

### GENLOCK IN:

VBS (BNC-type) ×2  
VBS (1.0 Vp-p) or black burst (0.3 Vp-p), loop-through, with 75-ohm termination switch  
HD, VD (BNC-type) ×2 in each  
4 Vp-p, loop-through, with 75-ohm termination switch

### CONTROL IN (4-pin) ×1

AUX IN (BNC-type) ×1

TITLE (8-pin) ×1

Ground ×1

AC IN ×1

### Power requirements

220 to 240 V AC, 50/60 Hz

### Current consumption

0.25 A

### Storage temperature

−20°C to +60°C (−4°F to +140°F)

### Operating temperature

−5°C to +45°C (23°F to 113°F)

### Dimensions and weight

#### Camera head

Dimensions: 70 × 75 × 113.5 mm (w/h/d)

(1 7/8 × 3 × 4 1/2 inches)

not including projecting parts and the cable

Weight: 600 g (1 lb 5 oz)

not including the cable

#### Camera control unit

Dimensions: 424 × 88 × 283 mm (w/h/d)

(16 3/4 × 3 1/2 × 11 1/4 inches)

not including projecting parts

Weight: 6.5 kg (14 lb 5 oz)

### Accessories supplied

Title generator (1)

AC power cord (1)

ND filter (1)

Rack mount bracket (2)

Screws (4)

Design and specifications subject to change without notice.

### Optional accessories

Zoom lens: VCL-1012BY (×12)

VCL-915BY (×15)

Microscope adaptor: MVA-33, MVA-20 (with automatic lighting adjustment function)

Coupler: MVAC-33-O (for Olympus VANOX, BH-2 series microscope)

MVAC-33-N (for Nikon V series, X/Y series microscope)

Operation microscope adaptor: MVA-365 (one-way type)

MVA-375 (two-way type)

Endoscope adaptor: MVA-302, MVA-302F, MVA-302M

Camera cable: CCZ-A series cable (2 to 100 m)

CCZ-A camera cable adaptor: CCZZ-1E, CCZZ-1B (installable on a wall)

Extension cable for the title generator: RC-75 (3 m)

IR cut filter for medical use

## CHAPTER 2

### SERVICE INFORMATION

#### 2-1. REMOVAL

##### 2-1-1. Removal of Cover

- ① Remove the two screws on the cover and remove the six screws on the bottom plate.
- ② Remove the cover and bottom plate.
- ③ Remove the four screws on the side cover.
- ④ Remove the side cover.

### 2-1-2. Removal of Front Door

- ① Remove the two screws.
- ② Loosen a screw.
- ③ Shift the slide guide.
- ④ Open the door.
- ⑤ Pull up the front door.

### 2-1-3. Removal of Front Panel

- ① Remove the nine control knob.
- ② Remove the four screws.
- ③ Remove the front panel.

#### 2-1-4. Removal of Switching Regulator

- ① Remove the sixteen screws and remove control knob on the rear panel.
- ② Remove the rear panel, reinforcement frame, AC switch, CN-17 board.
- ③ Remove the four screws on the switching regulator.
- ④ Remove the switching regulator.

## 2-2. REPLACEMENT OF FILTER PLATE

Remove the three screws and remove the optical filter unit

(Spare Filter)

	Part No.	Description
ND	1-547-310-11	FRONT FILTER UNIT
MD	1-547-311-11	FRONT FILTER UNIT

NOTE: When the MD filter is to be used, then, turn ON the switch S1 on the PR-99 board (see page 4-3).

## CHAPTER 3

### THEORY OF OPERATIONS

#### 3-1. PR-99 board

The PR-99 board is composed of three blocks, a process circuit, automatic circuit and mix circuit.

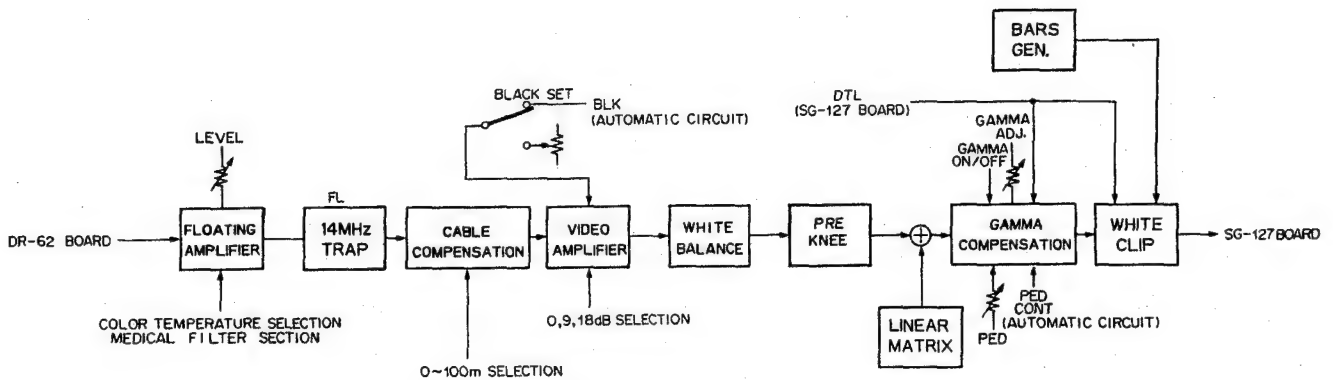

##### <Process circuit>

##### (1) Basic composition

The process circuit accepts the R, G and B signals sent from the driver circuit DR-62 board in the camera head, and outputs to the encoder after processing the signals as follows. It also contains the color bar generation circuit.

- Floating amplifier, color temperature selection circuit
- Cable compensation circuit
- Video amplifier gain selection circuit
- Black set
- White balance
- Pre-knee circuit
- Linear matrix circuit
- Gamma compensation
- Pedestal
- White and black clip circuit
- Color bar generation circuit

##### (2) Block diagram (R channel)

### (3) Circuit description

When the circuits of the R, G and B channels are the same, only the G channel is described, and only the different points are explained on the R and B channels.

#### 1) Floating amplifier and color temperature selection circuit

A video signal of 300 mV p-p (100% input) to both ends of the R111 75-ohm termination resistor from the DR-62 board in the camera head using a 75-ohm coaxial cable, passes the floating amplifier, which is composed of Q40 through Q44 to cancel the hum picked up by the cable. Then the 14 MHz clock component which is leaked into the signal in the camera head is reduced by the FL2 14 MHz trap filter. The RV1 adjusts the video amplifier output at TP6 so that it will be 200 mV p-p.

In the R and B channels, electrical color temperature selection is performed by Q4 and Q82. (Refer to Table 1.)

In the R channel, S1 is also provided to reduce the sensitivity when a medical filter is attached.

Table 1

	Q4	Q82
3200°K	ON	OFF
5600°K	OFF	ON

#### 2) Cable compensation circuit

A signal of 300 mV p-p input to Q51 is reversed by the Q51 grounded emitter amplifier, and sent to the Q58 buffer. The signal from the emitter of Q51 passes one of Q52 through Q55, and is buffered by Q56. Then the high frequency component is increased and reversed by Q57, and the signal is sent to the Q58 buffer.

Cable length, 0, 25, 50 or 100 m, is selected by Q52 through Q55, and the amount of compensation is decided by the resistive dividing ratio of R141 through R145. (Refer to Table 2).

Table 2

	Q52	Q53	Q54	Q55
0 m	OFF	OFF	OFF	ON
25 m	OFF	OFF	ON	OFF
50 m	OFF	ON	OFF	OFF
100 m	ON	OFF	OFF	OFF

#### 3) Video amplifier gain selection

The video amplifier gain selection circuit is composed of the video amplifier of Q63 through Q67, gain selector by feedback loop of Q61 and Q62 (refer to Table 3), and DC level fixed circuit of IC6 and Q58. The signal of 300 mV p-p input from the Q59 buffer becomes 200 mV p-p at TP2 when the gain is 0 dB, and the DC is clamped to 0.6 to 0.7 V.

Table 3

	Q61	Q62
0 dB	ON	ON
9 dB	ON	OFF
18 dB	OFF	OFF

#### 4) Black set

Black set is performed by switching the black set control voltage (BLK) and the voltage of the black set variable resistor (BLK SET) by IC12. For switching, an H SAMPLE pulse supplied from the SG-127 board is used. The output voltage shown in Figure 1 is added to the feedback signal of the clamp of the gain-up amplifier (Q63 emitter), and the pedestal level is adjusted by RV5 G BLK SET so that it does not change at 0, 9 and 18 dB by the output of the process circuit.

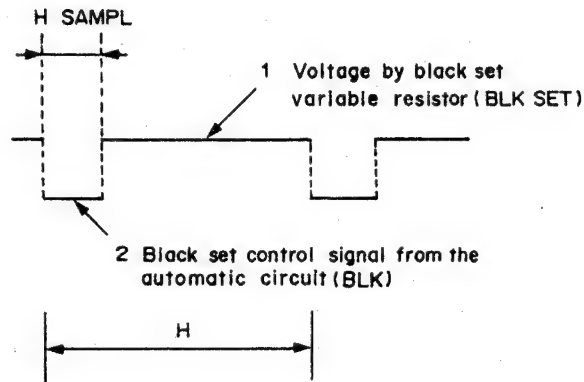

Figure 1 Black set

#### 5) White balance cleaning circuit

The signal of 200 mV (0 dB), which is output from the video amplifier circuit, passes the cleaning circuit of IC19 and IC20 for cleaning the damage caused by the Q68 clamp and the unnecessary signal output from CCD. The voltage sampled at pin 3 of IC6 passes the IC20 voltage follower, and only the signal in the pre-blanking period is replaced with the video signal by IC19. The pre-blanking signal (PRE BLKG) is input from the SG-127 board. The signal of 200 mV p-p input to IC7 is amplified by 2.5 times, and the signal of 500 mV p-p is output from pin 12. The voltage of the G channel at pins 8 and 10 is fixed to 2.5 V. IC7 is originally used for a balanced modulator, but it is used as a gain amplifier in this circuit. The voltage of the R and B channels at pins 8 and 10 is adjusted so that it matches that of the G channel by RV7 and RV9 variable resistors which set the pre-set conditions. In automatic white balance adjustment, the white balance control voltage (0 - 5 V DC) supplied from the automatic circuit is added to the R and B channels to control the white balance with the G channel. The manual white balance adjustment is also possible by the manual control voltage supplied from the automatic circuit.

#### 6) Pre-knee circuit

The pre-knee circuit is a compression circuit of extremely bright light input so that the dynamic range is secured in the later stage. When the base voltage of Q72 becomes higher than the voltage decided by RV8, etc., D12 is set in the conducting condition, and the compression begins. This circuit compresses the signal from 103 to 500%. (Refer to Figure 2.)

Figure 2 Pre-knee characteristics

#### 7) Delay line, grounded base amplifier

In the R channel, a signal of 500 mV p-p passes the Q34 buffer, is delayed by 165 ns by DL1, and is amplified to 650 mV p-p by the Q36 grounded base amplifier. The delay of 165 ns is to make the phase of the signal agree with that of the DTL signal supplied from the IE circuit.

#### 8) Linear matrix

The linear matrix is a circuit used to obtain life-like color as much as possible by compensating the negative hue indicated by the slanted lines in Figure 3. The input and output are as shown below.

Ro, Go, Bo: Output

Ri, Gi, Bi: Input

$$R_o = a(R_i - G_i) + b(R_i - B_i)$$

$$G_o = c(G_i - R_i) + d(G_i - B_i)$$

$$B_o = e(B_i - R_i) + f(B_i - G_i)$$

Figure 3

The signals input to the base of Q118 and Q119 from the R and G channels respectively pass the differential amplifier composed of Q118, 119 and 120, and  $a(R - G)$ ,  $c(G - R)$  are obtained after passing through the buffer.  $b(R - B)$ ,  $e(B - R)$ ,  $d(G - B)$  and  $f(B - G)$  are obtained in the same way, and they are mixed to the R, G and B channels as shown in the equations above.

#### 9) Gamma compensation circuit

In the R channel, a signal of 650 mV p-p, which is output from the Q37 buffer becomes 600 mV p-p at pin 16 of IC3 as a result of resistive dividing by R105, R360 and R371. It is mixed with the DETAIL signal input to pin 13 of IC3 from the SG-127 board in the differential amplifier in IC3, and the gamma is compensated. The gamma compensated signal is output from pin 10 of IC3, and mixed with the linear signal output from pin 6 in RV23, and the gamma is decided. Q38 and Q39 are the gamma ON/OFF switches. When Q38 is ON and Q39 is OFF, the amount of gamma compensation can be varied by RV23. When Q38 is OFF and Q39 is ON, the gamma compensation is set to OFF, and the linear signal is output. When the gamma compensation is set to ON, the amount of gamma compensation decided by RV23 is fed back to the differential amplifier in IC3 through pin 12 of IC3, and the amplifier functions as a non-linear amplifier with gamma characteristics.

The RV24 GAMMA BAL is adjusted so that the 100% video level point does not change according to the gamma of RV23, and the gamma is adjusted by RV23 so that the cross point of the gray scale becomes 55 IRE (gamma = 0.45).

### 10) Pedestal

In the R channel, CLP3 sent from the SG-127 board is input to pin 5 of IC3, and the main-line signal with the gamma compensated is sampled by the period of 1H by the pedestal sample hold circuit in IC3. The sampled DC voltage is compared with the pedestal control voltage (0 - 5 V DC) supplied from the automatic circuit to pin 3 of IC3, and the DC voltage to decide the pedestal level is fed back to the differential amplifier in IC3.

The pedestal level is adjusted by adding the DC voltage input to pin 1 of IC3 and decided by RV27 to the pedestal control voltage input to pin 3 of IC3 from the automatic circuit. The pedestal control voltage of the R and B channels are the output of the automatic black balance, and when the automatic black switch is set to ON, the voltage is decided so that the pedestal of the R and B channels becomes the same as that of the G channel.

The control signal of the master pedestal being set is also input to pin 3 of IC3 together with the R pedestal control signal.

### 11) White clip

The R channel signal input to pin 7 of IC5 is mixed with the DETAIL signal supplied from the SG-127 board to pin 6 of IC5, and white-clip is performed in the white clip circuit in IC5.

The WHITE CLIP ENABLE signal, BARS CONT signal and BLKG pulse sent from the automatic circuit are input to the logic circuit of IC8 and WHITE CLIP level set circuit composed of D14 and Q76. The WHITE CLIP ENABLE signal sets the BLKG pulse, which is sent to the white clip circuit from pin 6 of IC8, and ON and OFF by setting the WHITE CLIP ENABLE signal to L or H. This is because the level cannot be correctly compared in automatic white balance adjustment if the signal has been clipped. The BARS CONT signal input to pin 1 of IC8 is a control signal used to set the white clip circuit to OFF when a color bar signal is generated.

RV14 decides the G channel WHITE CLIP level. RV15 and RV16 are used to adjust the R and B channel WHITE CLIP level to that of the G channel. The BLKG pulse which decides the WHITE CLIP level is input to pin 4 of IC5. If the level of the main-line signal is higher than that of the BLKG pulse, the higher part will be clipped. The BLKG pulse is added to the main-line signal as shown in Figure 4. White clip adjustment is performed by adjusting the white clip point of the G channel to 115% by RV14, and then those of the R and B channels by RV15 and RV16 so that they match that of the G channel.

Figure 4 White clip

The signal output from pin 3 of IC5 passes the 14 MHz trap filter composed of R397, L2 and C154, and the buffer of Q135 and Q134, and is sent to the encoder circuit and automatic circuit.

### 12) Color bar generation circuit

The BLKG pulse sent from the automatic circuit is input to pin 13 of IC9, and reversed in IC9. Then it is input to the multivibrator. When the BLKG pulse is low level and the BARS CONT signal voltage input to pin 16 of IC9 from the automatic circuit is low level, the multivibrator operates. The multivibrator generates a signal equivalent to 14 cycles, two times of 7 lines of white, yellow, cyan, green, magenta, red and blue in the effective screen. The pulse width is adjusted by adjusting the width of black level by RV20. The output of the multivibrator is added to the binary counter in IC9, counted down to 1/2 and is supplied as B output. Then it is counted down again to 1/2 and supplied as G output. (Refer to Figure 5.) The BARS level is adjusted by RV19. The BARS signal of the G channel is sent from pin 2 of IC9, that of the R channel from pin 6, and that of the B channel from pin 7 to the BARS switch circuit in IC11, 5 and 16 respectively.

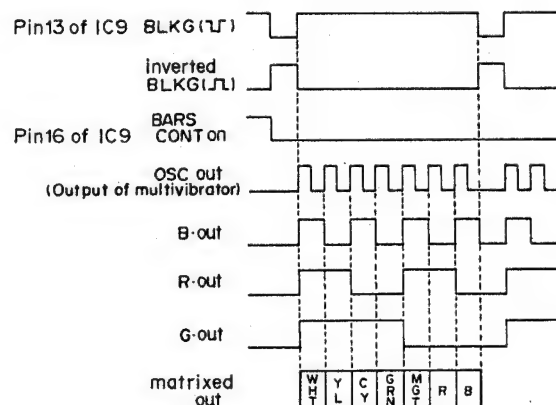

Figure 5 Color bar

## <Automatic circuit>

### 1) Basic composition

The automatic circuit has functions such as automatic white balance, automatic black balance, automatic iris, character generator, etc.

The R or B channel signal is compared with the G channel signal, and the differences are detected. Then the analog DC output signal which reduced the difference to 0 is generated and supplied. MPU IC108 (HD44860342), is the center of the automatic control circuit, and the program is written in ROM of 2 k words in IC108.

Memory size of MPU:

ROM: 2048 words × 10 bits

RAM: 160 words × 4 bits

When "MEMORY: NG" is displayed, all analog control voltages are automatically set to the center value of the controllable range (pre-set mode: analog value DC + 2.5V). In this case, automatic white balance and automatic black balance should be adjusted again.

### 1) Automatic white balance circuit

The loop is made so that  $(R - G = 0)$  or  $(B - G = 0)$  is obtained. When the differential voltage becomes minimum, "WHT: OK" is displayed on the monitor screen.

The differential output of  $(G - G)$  is buffered by Q206, and clamped to 0 V by the HD pulse in Q208.

Then it passes the buffer amplifier of Q209 through Q212, and is sampled and held by the Y peak signal by Q213, C209 and C213.

The Y peak signal is made from the dummy Y signal by mixing the R, G and B signals in resistor matrix ( $Y = 0.5G + 0.25R + 0.25B$ ) of R434 through R436 after being buffered by Q236 (R), Q201 (B) and Q202 (G).

The dummy Y signal is amplified by 10 dB to the level of the gate circuit in the next stage by Q216, and is gated by the white window pulse in D104.

The signal is gated by the window pulse because the detection of white balance is executed by the signal in the circle with a diameter of 75% width on the screen but not all over the screen.

The window pulse is made from the H and V parabola waves.

The H and V parabola waves are input to the collector of Q220.

Q220 is set to off during automatic white and black balance adjustment, and to on in other cases, i.e., the H and V parabola waves are picked up and added to pin 3 of comparator IC103 during this period only.

The comparator makes the window pulse by clipping the level lower than the reference voltage input to pin 2. The detecting range of white balance is decided here.

The dummy Y signal is picked up by D104 in the HIGH period of the window pulse, and is buffered by Q217, and added to the video amplifier Q218.

The emitter of Q218 is grounded through D102 (forward direction bias) so that a signal lower than 0 V is not output, i.e., the D102 functions as a clip.

The purpose of this clip is to obtain the brightest (Y peak) signal at the center of the screen.

This Y peak signal is amplified to the FET input level of the sampling circuit Q213 (2SK94) by Q218 and Q219. The (G - G) signal mentioned before is sampled and held by this Y peak signal, amplified by the operation amplifier IC104, and compared with the 8-bit digital signal output from the microcomputer by IC102 of the comparator. Then A/D conversion is performed.

The 8-bit digital signal after A/D conversion by IC102 is memorized in IC108 as a reference voltage ((G - G) differential voltage).

Conventionally an (R - G) signal is directly made. However, the signal is affected by the temperature characteristics of circuits and aged deterioration in the process of making the R - G signal. To avoid this, the (G - G) differential voltage is first made, and (R - G) or (B - G) is compared by referring to the voltage.

When the reference voltage of (G - G) is memorized, the microcomputer sends the order of the next step, and analog switch IC101 is switched to R (to pins 12 and 3). Then (R - G) is obtained by differential amplifier Q204, 205 and 207, and it is memorized in the microcomputer as a differential voltage of (R - G) by the same route as (G - G).

The differential voltages of (G - G) and (R - G) memorized in the microcomputer are compared in the microcomputer, and when the difference is within 1 bit (least significant digit of 8-bit signal), the system decides that the white balance is adjusted.

Figure 9

The CTL in the range from maximum value 11111111 (analog output of 5 V) to minimum value 00000000 (analog output of 0 V) is output. When the R gain control is finished, next stage (B gain) begins.

The B gain control is the same as the R gain control.

The compensation signal, R gain (or B gain), is made by comparing it with the R gain (Z) prepared by the software of the microcomputer (RAM).

The compensation signal (R gain) of  $(Z - \Delta)$  is output from the microcomputer as  $(R - G) - (G - G) = \Delta$ .

$$Z - \Delta \rightarrow Z$$

This compensation signal is a digital signal so that it is D/A conversion is performed by the ladder resistor of RB101, and buffered by IC112, and supplied to analog switch IC109/110.

As VD is considered as a cycle, this data includes 16 channel data, and is controlled by the output of the microcomputer (pins 32, 33, 34, 35 and 1) in each mode, and the data corresponding to the mode is output.

The 3VD period is repeated until the amplitude of the R signal becomes the same as that of the G signal. In case of  $(R - G) - (G - G) > \Delta$  the compensation of  $(Z - \Delta \rightarrow Z)$  is performed in the microcomputer.

If the white balance cannot be adjusted within a 3VD period,  $(R - G)$  is made again as a new data, and the same procedure is repeated.

When the compensation of the R channel is completed, one of the analog switches in IC101 is switched to pin 13, and the gain control of the B signal begins.

When the gain is controlled so that the amplitude of the B signal becomes the same as that of the G signal, like the R signal, it is written in the 8-bit RAM, and the white balance adjustment is completed.

When the control completed, the closed loop of microcomputer IC108 is opened, and the gain is controlled by the data stored in the 8-bit RAM.

This is executed within about 1 second.

When the white balance adjustment is completed, a character generator functions, and the operation mode is displayed on the monitor. When the white balance has been adjusted, "WHT: OK" is displayed on the monitor screen.

## 2) Automatic black balance circuit

Automatic black balance adjustment is executed as follows. A detection circuit system is almost the same as that of an automatic white balance adjustment circuit.

i. A lens iris is forced to be closed mechanically, and the close of the iris is electrically checked by detecting light input.

ii. Black tracking operation

Black tracking is the operation with which the black level of an output signal does not change as the GAIN selector setting is changed to 0 dB, + 9 dB and + 18 dB with the lens closed. The operation is executed in order of  $G \rightarrow B \rightarrow R$ .

iii. Black balance operation

Black level of the R and B channels is adjusted so that it becomes the same by referring to that of the G channel.

[Operation for closing an iris]

For automatic black balance adjustment, light input should be cut. So the lens iris is forced to be closed when the AUTO BLK switch is pressed independent of the AUTO/MANUAL selector setting.

Black balance adjustment begins when the iris is confirmed to be closed by detecting whether the amplitude of a video signal of the G channel (master) becomes 0 (pedestal level).

When the black balance switch is set to ON, the level of pin 53 of microcomputer IC108 becomes "L", and "L" is kept during black balance adjustment. A high-level signal is output from pin 8 of IC108, and Q227 is set to ON. Then "L" signal from pin 53 of IC108 is added to D111. Q222 is then set to ON, and "H" voltage appears at the collector of Q222, which is added to the lens as a lens iris close signal, and the lens is closed.

When the lens iris is closed, the R, G and B signals from the process circuit are supplied at a pedestal level (without a video signal).

During automatic black balance adjustment, as the "L" level is kept at pin 53 of IC108, an "H" level is added to D122 through inverter of IC107.

As an "H" level is also supplied to the other end of D122 from the microcomputer, the output of D122 is the result of an AND operation, and is supplied to pin 10 of analog switch IC101, which is switched to NO (pin 1).

As a blanking signal is supplied to pin 1, it is added to the (-) side of differential amplifier Q204, 205 and 207 through this switch.

The G signal is added to the (+) side of the differential amplifier through pin 5 and pin 4 of another analog switch IC.

A "G-BLKG" signal is obtained as a differential amplifier output. As the BLKG signal in this case is output with HIGH impedance of only R407 (1.2 k ohms) until the iris is closed because Q203 is set to OFF, wide amplitude can be obtained.

If a G signal is used instead of a "G-BLKG" signal, a correction detection in the microcomputer is impossible because the pedestal level of the G signal can be manually adjusted and the amplitude of the G signal becomes narrow by temperature characteristics of the circuit or misadjustment.

To avoid this, when the AUTO BLK switch is set to ON, a master pedestal level is raised by a MASTER PED control signal.

"G-BLKG" signal, output of a differential amplifier, is stored in memory of the microcomputer after A/D conversion in the sample and hold circuit in the same manner as white balance adjustment.

When the "G-BLKG" signal becomes the value equivalent to 50 of the differential amplifier output, (microcomputer output: 10000000 = 80 CTL), the system decides that the iris is closed. To confirm the lens close, A/D conversion of the differential amplifier output is performed twice, and when the difference becomes within  $\pm 1$  bit, the system decides that the iris is completely closed, and the next black tracking operation begins.

#### [Black tracking operation]

Even if the lens is closed, an output signal of a pre-amplifier contains a black current component of CCD. When the gain switch is set to +9 dB the black current is amplified in the process circuit, and the black balance cannot be kept because of the pedestal level change.

Black tracking operation makes the pedestal level of the R, G and B signal outputs not change even though the gain select switch setting is changed to 0 dB, 9 dB and 18 dB with the lens closed to obtain a stable pedestal level. When the lens closed is confirmed, Q203 is returned to ON, and the standard blanking level is obtained.

As a minus input of a differential amplifier, a blanking pulse is added through pins 1 and 15 of IC101, and the G channel signal is added as a plus input through pins 5 and 4 of IC101. Thus a G-BLKG signal can be obtained from the differential amplifier.

A/D conversion of the G-BLKG signal is performed with the gain of 0 dB, and the data is memorized in the microcomputer. Then a +9 dB gain-up control signal is output from pin 8 of microcomputer IC108, which sets the gain of the process circuit to +9 dB. The G-BLKG signal at +9 dB is made in the same way as at 0 dB. Then it is memorized in the microcomputer and compared. Even if the level difference  $\Delta$  between the G-BLKG signals at 0 dB and at +9 dB is output as a compensation signal, the pedestal level after the compensation is the value at +9 dB, which has no mean for compensation. Therefore  $\Delta/2$  is added to IC101 in the process circuit as a compensation signal, and the G-BLKG signals at 0 dB and at +9 dB are compared again, and a compensation signal of  $\Delta/2$  is output. This operation is repeated until the pedestal level difference at 0 dB and +9 dB does not occur. When the level difference  $\Delta$  between the G-BLKG signals at 0 dB and at 9 dB becomes within  $\pm 1$  bit, the microcomputer decides that the black tracking operation for the G channel is completed, and the adjustment for the R channel and B channel begins. When the adjustment of all channels is finished, black tracking operation is completed.

#### [Automatic black balance operation]

In automatic black balance operation, an output of the process circuit is observed with the lens closed. (G - R) and (G - B) are obtained by comparing the G channel black level with those of the R and B channels in order, and the (R-PEDESTAL) and (B-PEDESTAL) DC signals are supplied to the process circuit to make (G - R) and (G - B) 0, and the pedestal level of R, G and B is adjusted to the same level.

A reference signal is made from (G - G), and A/D conversion of (R - G) is performed. Then the R-PEDESTAL signal is made by D/A conversion of the difference between (G - G) and (R - G), and is supplied to the process circuit. The same procedure is performed for (B - G). These operations are the same as those of the automatic white balance operation except that the lens is closed in the automatic black balance operation.

As a Y signal of a sampling pulse is 0, black balance, black tracking and lens close cannot be detected by the peak detection. To output High to the Y signal line constantly by the peak detection of Q218, DC voltage is added by setting the base of Q215 to High with the black balance switch set to ON. Then the window pulse made by a H/V parabola wave is added to the Q213 sample and hold circuit as a sampling pulse for black balance adjustment. When black balance of (R - G) and (B - G) is adjusted, "BLK OK" is displayed on a monitor screen for about 4 seconds.

#### 3) Automatic iris adjustment circuit

The R, G and B channel signals sent from the process circuit are mixed in NAM (Non Additive Mix: the largest signal of R, G and B signals is output) circuit of D107 and D108, and passes R462. A BLKG signal which has passed R461 and a V SAW signal which has passed R464 and D109 are resistor-mixed with the NAMY signal, which is input to pin 12 of the IC104 buffer.

The output of pin 14 of IC104 is peak-detected by C225, and average-detected by R465 and C226, and resistor-mixed by RV102. In the circuit, the level from peak to average can be changed by RV102.

An output of the average detection is input to pin 6 of IC103, and is used to detect "LOW LIGHT".

RV101 is an adjustable resistor to set the LOW LIGHT indication, and can adjust the video level from 40 to 47 IRE. This makes the indicator light in LOW LIGHT.

The output whose ratio of the peak and average value is decided by RV102, is input to pin 6 of the differential amplifier IC104. The reference voltage input to pin 5 of IC104 is decided by RV103, which decides the iris setting. Auto iris output voltage can be changed from 2.0 V to 7.4 V for adjusting the lens from open to close. However, to avoid hunting at the close end, a 3.4 V limiter is provided in D112.

The V SAW TOOTH signal is mixed at the input of an automatic iris adjustment circuit to detect the video level at lower 2/3 part of the screen. Then if the highlight such as a blue sky is shot in outdoor shooting, the automatic iris adjustment is not affected.

Figure 10

#### 4) Character generator circuit

Character is generated by IC115 (MN1237AD) in ROM. The data to display the conditions of white balance and black balance operation (WHT: OP or BLK: OP), and the results of the operation (WHT: OK, WHT: NG, etc.) is input from the microcomputer.

#### 5) Peripheral circuits of automatic adjustments

[Reset circuit when the power is turned on]

This circuit initializes the microcomputer by the rising edge of +5 V power source with a switching operation of Q231. IC121 and IC122, a voltage detector, controls the rising and falling characteristics of a power source within the specification of the microcomputer.

[Preset/memory selection circuit]

IC108 is a 1-chip C-MOS type microcomputer whose operating current is only 1 mA. In HLT mode, the current is further lowered to 1  $\mu$ A.

In HLT mode, an operation of the microcomputer is temporarily stopped, and the data only in RAM is kept.

When the level at pin 25 of IC108 is "LOW", i.e., the power is OFF, HLT mode is obtained. In HLT mode, the charge stored in a large capacity condenser (C271: 0.1F) as a back-up power source, is used as a power source of the microcomputer when S101 is set to OP. The back-up memory is kept for about a week. If the back-up condenser is discharged or S101 switch is set to ADJ, "MEMORY: NG" is displayed on a monitor when the power is turned on. When "MEMORY: NG" condition is set, all analog control voltages are automatically set to the center value of a controllable range (pre-set mode: Analog value DC + 2.5 V).

In such a case, adjust the automatic white and black balance again.

The ADJ position of S101 is used for maintenance adjustment. When the adjustment is finished, be sure to set the switch to OP.

#### <Mix circuit>

##### (1) Basic composition

The mix circuit is an interface circuit with the external equipment, and the composition is as shown below.

- R, G and B output
- External character generator mix
- Internal character, AUX IN mix
- Component output

##### (2) Circuit description

###### 1) R, G and B output

The R, G and B output is a circuit used to supply the R, G and B signals sent from the process circuit to the external equipment with a 75-ohm driver.

The G channel signal input from the process circuit passes the grounded base amplifier of Q304, and is buffered by Q305, then is sent to the external equipment with a 75-ohm driver composed of Q306 and Q307. A SYNC signal is sent to pin 1 of IC116 from the SG-127 board. It passes grounded base amplifier Q316 and the Q315 buffer, and mixing is performed at emitter of Q304. The SYNC level is adjusted by RV201, and L/H at pin 2 of IC116 controls ON and OFF of the SYNC signal.

###### 2) External character generator mix

This is a circuit used to mix the R, G, B and KEY signals sent from a title generator with a main-line signal.

In the G channel, a G character signal sent from the title generator passes grounded base amplifier Q320, is buffered by Q321, and mixed with the main-line through D211.

On the main line, a character signal of about 1.2 V p-p appears. The KEY signal sent from the title generator is a signal for the OR operation of R, G and B and for black characters, and input to the base of Q76 in the process circuit. A blanking signal is also input to the base of Q76, and the blanking pulse is set to LOW at the phase when the KEY signal is input. Therefore, when the KEY signal is input to the base of Q76, a black character appears as a process output. When the signal is input to a character input of R, G and B, the R, G and B signals are added to the blanking level, and the character signal with a constant level can be obtained independent of the video level.

Figure 11 KEY signal

### 3) Internal character, AUX IN mix

The internal character mix is a circuit used to mix the warning indication output from an internal character generator with the main line signal.

A character from IC115 is input to the emitter of grounded base amplifier Q312 through R638, and is mixed with the main-line signal after passing the buffer of Q314. On the main line, a character signal of about 1.3 V p-p appears. The AUX IN mix is a circuit used to mix the cross hatch, window, title, etc. input from the external equipment with the main-line signal.

The signal input from the external equipment is terminated by 75 ohms. Then it is input to C311, passes the Q312 grounded base amplifier, and is input to the main line through the buffer of Q314. Q313 is an enable switch used to inhibit the internal character and AUX IN signal output in the color bar mode or during white and black balance adjustment.

### 4) Component output

The component output is a circuit used to compose the Y, R-Y and B-Y signals from the R, G and B signals sent from the process circuit.

The R, G and B signals sent from the process circuit are input to the bases of Q234, 236 and 235 respectively. The Y signal is made by the matrix resistor of R686, 687, 745 and 688, and the level is adjusted by the Q327 grounded base amplifier (RV202). Then the signal passes the buffer of Q328. Q329 and Q330 are the switches to select R, G and B outputs or a component output. There are two R, G and B outputs: One of them can be switched to the component output. The signal passed Q329, and is buffered by Q331, then is sent out by the 75-ohm driver of Q332 and Q333.

An R-Y signal is composed by the matrix resistor of R689, 690 and 691, and a B-Y is composed by that of R692, 693 and 694. They are sent out in the same way as the Y signal.

## 3-2. SG-127 board

The SG-127 board is composed of three blocks: the IE (Image Enhancer) block, SG (Sync Generator) block, and EN (Encoder) block.

### <IE block>

The IE block consists of the circuits listed below:

- 14 MHz multiplier circuit
- 1H/2H DELAY signal generation circuit
- H/V DETAIL signal generation circuit
- Aperture compensator circuit

### (1) 14 MHz multiplier circuit

This circuit multiplies the 14 MHz clocks of SG in order to provide the 28 MHz carrier signals which are required for the generation of the 1H/2H DELAY signals as described in the following subsection (2).

After a 14 MHz clock is received from SG by the 14 MHz multiplier circuit, it crosses the Q44 buffer then is divided into a two-stage delay block: the delay block consisting of C57, L19, and C58 as well as the delay block consisting of C110, L9, C111, L10, and C112. The former block respectively inputs the 4.5 V DC voltage into the respective multipliers of IC5. Because the two pin 4 and pin 10 inputs of IC5 are input with a  $\pi/2$  ( $90^\circ$ ) phase difference (there is a difference of  $\pi/2$  in the delay between the two delay blocks), the multipliers output 28 MHz pulses. These pulses are then sent via the Q45 buffer to the next circuit.

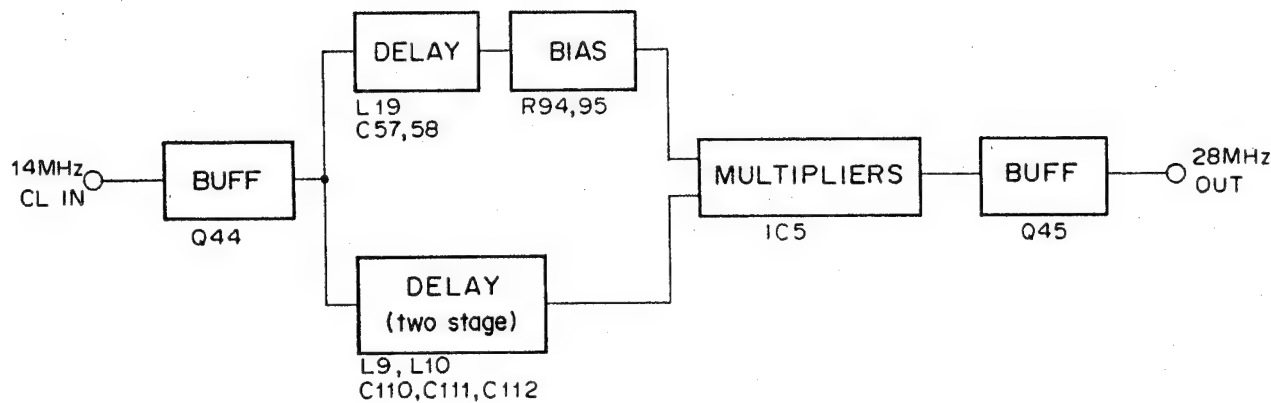

Fig. 2-1

## (2) 1H/2H DELAY signal generation circuit

This circuit generates the 1H/2H DELAY signals which are required for the generation of the H/V DETAIL signals.

Based on the input from the PR-99 board, the 500 mVp-p Gch signal has its high-pass component cut off by the LPF (Low-Pass Filter) formed by L22 and C127, crosses the Q1 buffer, then is clamped by the Clamp pulse (CLP3) which is input to Q2. (The blanking section is 0 V DC.) Next, a Reference pulse is added to the video signal at IC4. At pin 10 of IC4, a single Reference pulse is input during the V blanking interval, then the pulse is added at a DC level determined by the resistive dividing ratio of R4 and R5. (This will be required for the AGC level adjustment of 1H/2H which will be discussed later.) The output of IC4 crosses the Q4 buffer, is amplified and modulated at modulator IC1 (the carrier is used for obtaining the 28 MHz pulse described in the preceding subsection), is input to the Q6, Q7, Q8, Q9, and Q10 drivers, then is input to the 1H DELAY LINE (DL1). The output of 1H DELAY LINE crosses the AGC (Automatic Gain Control) AMP formed by Q11, Q12, Q13, Q14, and Q15, enters the NAM circuit formed by Q16 and Q17, then the carrier component is dropped and demodulated at C25, L5, and CV2. The demodulated signal (1H delayed) crosses the Q20 buffer, is clamped at Q21, is subjected to pre-blanking cleaning at IC3, crosses the Q22 and Q23 buffers, then is input to the 165- $\mu$ s DELAY LINE (DL2). This will later be used by the PR-99 board to perform phase alignment when adding the DETAIL signal to the video signal. The output of DL2 is adjusted to the required level by the base ground amplifier Q24, then is sent via the Q25 buffer to the PR-99 board where it becomes a main signal line. At this time, the output of TP6 is 650 mVp-p.

On the other hand, the demodulated signal crosses the Q19 buffer, is clamped at Q28, then samples the Reference pulse at IC4. Similarly, the modulated signal crosses the Q26 buffer, is clamped at Q27, then samples the Reference pulse at IC4. The level of the two Reference pulses is input to the comparator IC2, the IC2 output is sent to Q13, then the level of the 1H DELAY signal is controlled by the AGC AMP. Consequently, the 1H DELAY signal is maintained at the same level as the input signals. A slight difference in level which is beyond control has been designed to be corrected at RV7.

Moreover, for the purpose of generating the 2H DELAY signal, the output of the AGC AMP is input to the driver formed by Q29, Q30, Q31, Q32, and Q33, then passes through the 1H DELAY LINE. The circuit for 2H DELAY signal generation is exactly identical to that for 1H DELAY signal generation. This enables 1H DELAY and 2H DELAY signals to be obtained which have the same level as the input signals.

## (3) H/V DETAIL signal generation circuit

### 1) V DTL GEN

The 1H DELAY and 2H DELAY signals produced by the 1H/2H DELAY signal generator are input together with the OH signal into the V DTL GEN, thereby generating the V DTL signal by the process shown in Fig. 2-2.

To obtain the V DTL signal, the 2H DELAY and OH signals are mixed (C) at the Q54 emitter and the 1H DELAY signal is applied to the Q54 base (doubled).

The V DTL signal passes an LPF (1.5 MHz, -3 dB) formed by L16 and C70, then is output by the Q56 buffer.

Fig. 2-2

### 2) H DTL GEN

To prevent the occurrence of beating while the DTL signal is conveyed by the 3.58 MHz subcarrier, the DTL signal first crosses a comb-shaped filter (R108, R109, R110) to completely eliminate the 3.58 MHz component. The SC component of 3.58 MHz has the same phase as the mixed non-delayed OH signal and a 2H DELAY signal. In contrast, the 1H DELAY signal has an inverted phase (as shown in Fig. 2-3), so the combining of these signals will mutually cancel the phase difference.

Fig. 2-3

This unit generates the H DTL signal by mixing the G-CH signals of OH, 1H, and 2H delay with the R-CH signal from the PR-99 board. The XC-007 does not perform signal processing by staggering the pixels, however, so the R-CH signals are not mixed.

Because only the G-CH signals lack resolution, the H DTL signal is generated after mixing in the R-CH signals obtained by staggering the pixels. The H DTL signal is generated by the process shown in Fig. 2-4. These H DTL and V DTL signals are mixed at RV1, then are adjusted at RAT10.

1: Input signal

2. Primary differential output

3. Rectified output

4. Secondary differential output (H DETAIL signal)

Fig. 2-4

Although the resulting signal crosses the Q51 buffer then is differentiated at the differentiating circuit formed by L14 and C66, it then crosses the Q52 circuit and is again differentiated by the differentiating circuit formed by L15 and C67, then the H DETAIL signal is output by the Q53 buffer.

This H DTL signal component is based on a 4-MHz frequency.

### 3) Crispening

The signal resulting from the mixture of the H and V DTL signals is amplified at IC6, crosses the Q58 buffer, then is again input to IC6. The DTL signals are separated into the positive and negative poles then respectively subjected to limiting. As shown in the figure, all signals except the DETAIL signals contain a high-pass noise component. To prevent a drop in the signal/noise ratio due to this high-pass noise component, therefore, the high-pass noise component is removed by crispening (by limiting).

Fig. 2-5

Moreover, when the high-pass noise component is +18 dB, Q57 is switched OFF by the CONT signal from the PR-99 board, thereby raising the pin 11 voltage of IC6 so that crispening is intensified to prevent the deterioration of the signal/noise ratio. The positive and negative DETAIL signals are respectively output from pins 6 and 7 of IC6 and combined, then are input to control amp (IC7) after being cleaned at Q59. The Control signal from the DTL VR on the CCU's front panel is received at pin 8 so that the level of the DTL signals can be controlled. RV6 functions to adjust the clip-position level of the DTL control knob. The output of IC7 crosses the Q79 buffer, is mixed with the Aperture Compensator signal (to be discussed in the following subsection), crosses the Q81 AMP and Q80 buffer, then is sent to the PR-99 board.

#### (4) Aperture compensator circuit

When the pixels have been staggered to compensate for the inadequate resolution of only G-CH, this circuit functions to supply that high-pass component. This circuit is not provided for the XC-007 in which pixel staggering is not performed.

Since DXC-750 is equipped with this circuit, a maximum resolution of 700 lines can be achieved.

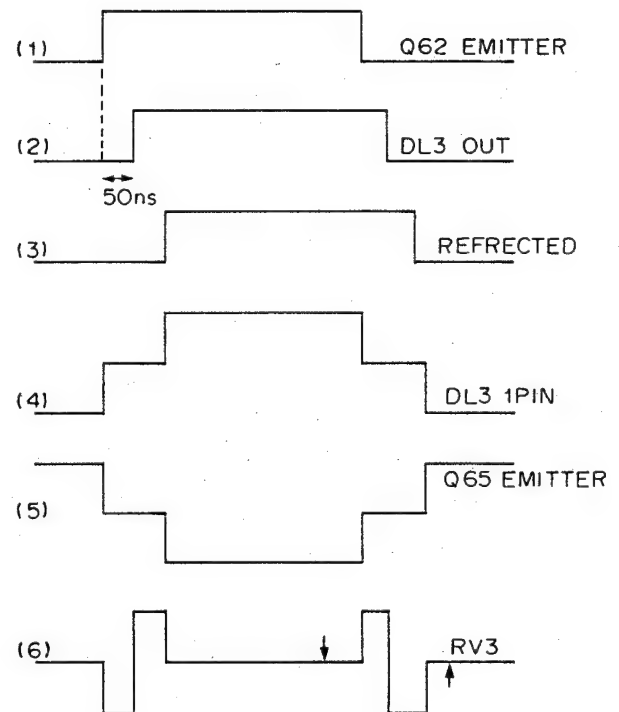

The output of the Q51 buffer crosses the Q62 buffer and is input to DL3. Because the DL3 output is not terminated, however, it is reflected (3) so that the input to DL3 becomes the waveform (4). (4) is reflected at Q64 and crosses the Q65 buffer, then becomes the waveform (5). On the other hand, output (2) of DL3 is input to the Q63 AMP so that (4) and (2) are mixed to obtain (6). RV3 is set to the level indicated by the arrow.

The peak of this high-pass component is 10 MHz.

The high-pass component generated in this way crosses the Q66 and Q67 AMP then is input to DL4 for the purpose of aligning the phase of the Aperture Compensator signal with that of the video signal.

At the crispening circuit which consists of two NAM circuits formed by Q69, Q70, Q71, and Q72, the DL4 output is respectively clipped at its upper and lower limits then is mixed (the processing principle is identical to that described for the DTL circuit). The resulting output is subjected to level adjusted at the AMP formed by Q73, Q74, and Q75, is cleaned at (RV5) IC8, then is output by the Q78 buffer. It is later mixed with the DTL signal and sent to the PR-99 board.

It is also possible to switch OFF the Aperture Compensation signal using S1.

### <SG block>

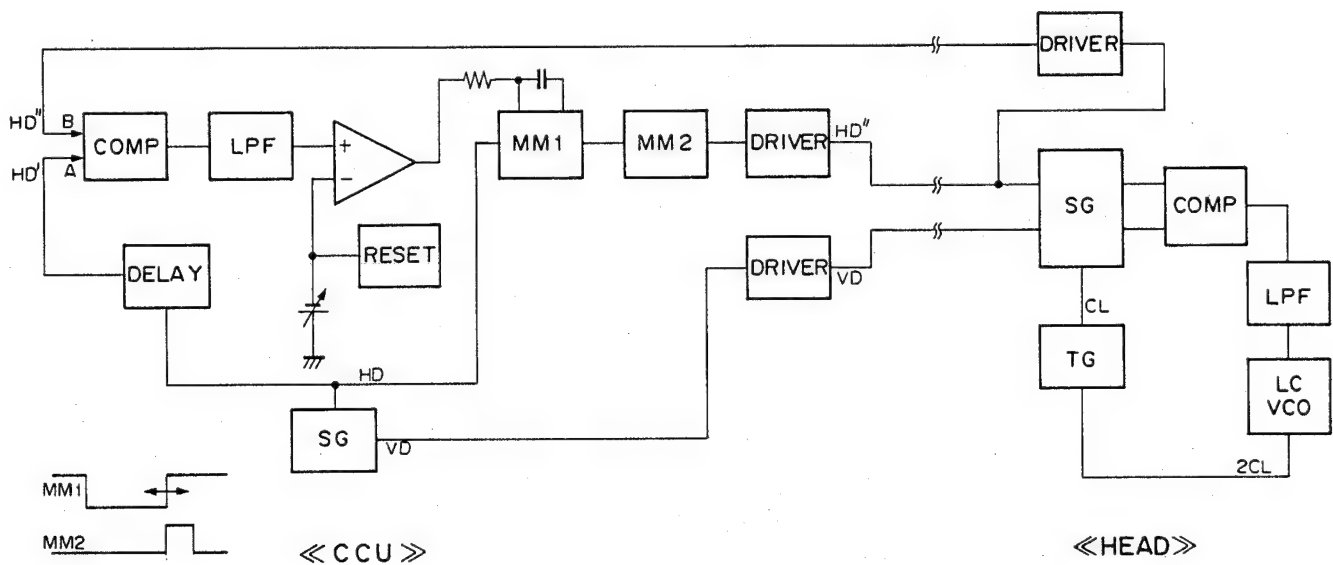

The SG block consists of the circuits listed below:

- HEAD/CCU sync circuit
- Internal/external sync circuit
- CLP1/CLP3/H SAMPLE/PRE BLKG generation circuit
- BLKG generation circuit
- CLOCK/HD/VD/SYNC driver

#### (1) HEAD/CCU sync circuit

The DXC-750 (XC-007) is a two-piece camera and the distance between its head and CCU can be extended to a maximum of 100 meters. The phase deviation between the head and CCU increases in proportion to the increase in distance, and phase alignment between the head and CCU must be performed each time that a cable of different length is used. Since automatic phase alignment is crucial to image measurement for medical purposes, which is one of the applications considered for this set, it was decided to provide a circuit that constantly maintains a fixed phase between the head and CCU.

The following figure shows a block diagram of this system. HD and VD signals are sent from the CCU to the head, then the head section of the system enters HD/VD GEN-LOCK mode. The HD signal that was sent to the head is returned to the CCU where it is compared with an internal HD signal, then a mono-stable multivibrator (MM) used to align the phases by shifting the phase of the HD signal to be sent to the head. That is, the longer the cable length, the faster the phase of the HD signals sent from the CCU.

The HD signal received from the SG-150 board is inverted at Q131 and then input to IC102. The pulse (positive) is output from IC102 at the rising edge (beginning). That pulse is input to another mono-stable multivibrator, then the pulse (negative) is output at the falling edge (end). The pulse next crosses the Q133 buffer, and is output by the driver formed by Q153 and Q154 (for transmission to the head). The VD signal is also sent from the SG-150 board, crosses the Q104 buffer, then is similarly output by the driver formed by Q105 and Q106.

The HD signal which is returned from the head is subjected to a DC cut at C206, terminated by  $75\ \Omega$ , speeded up at C207, inverted at Q101, inverted again at Q102, then subjected to waveform rectification and input to pin 3 of IC101.

On the other hand, the HS pulse received from the SG-150 board (the pulse that lags  $3.64\ \mu\text{s}$  after the all of HD: see the operating description of the SG-150 board) is input to pin 14 of IC101 where it serves as the reference pulse in the comparison of two pulses. As shown in the following figure, the output of pin 13 crosses an LPF (R310, C209, R311, C210) and the Q123 buffer, then is input to the OP AMP of IC103. Although a DC gain that is approximately three-fold exists, turn RV101 to adjust the DC gain to approximately 2.6 V DC at TP108. (When the cable used is 2.5 or 5 meters long.) This OP AMP output is input to mono-stable multivibrator IC102 where it is converted to DC voltage, thus changing the pulse width of MM1, shifting the pulse of the HD (MM2) signal to be sent back to the head, and achieving phase synchronization.

Furthermore, this circuit is designed to reliably achieve synchronization whenever the power is turned on or a reset operation is executed. The one-second reset time is determined by R535 and C341, during which time Q156 is switched ON and the + side of C211 is forced to 9 V. This ensures phase-locking when the power is turned on.

## (2) Internal/external sync circuit

This unit consists of three sync modes as follows:

- Internal sync mode (INT)
- VBS GEN-LOCK mode
- HD/VD GEN-LOCK mode

### 1) Internal sync mode (INT)

During NTSC use, the DC controlled by RV102 is received from the SG-150 board, and the clock frequency is adjusted to this input. Next, the required pulses are output from the SG-150 board.

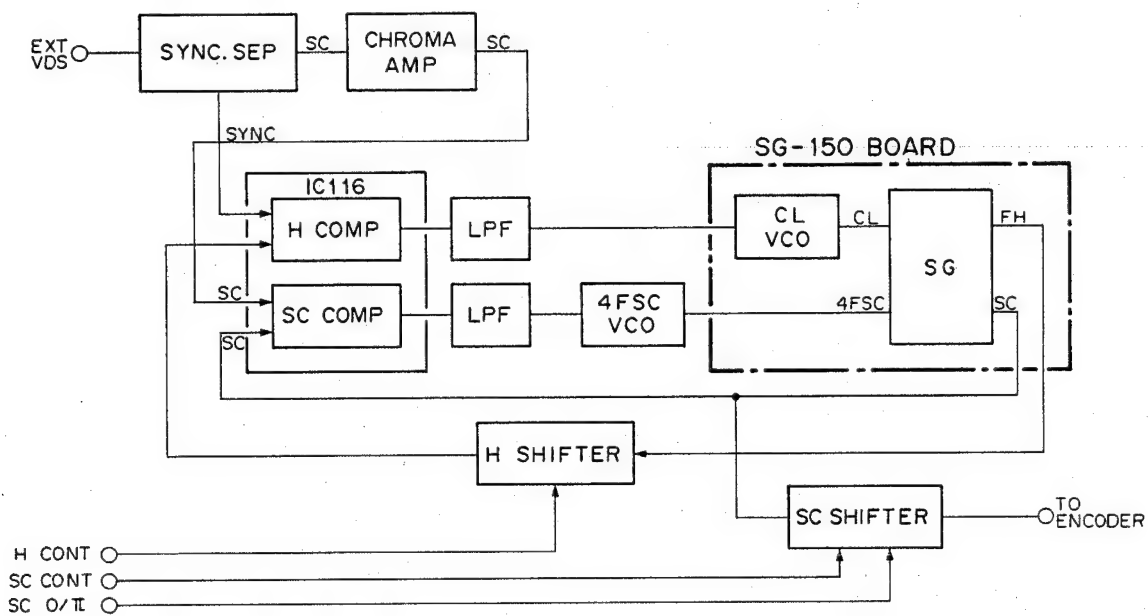

During PAL use, Q134 is switched ON and CP2 becomes active. The DC of RV102 is sent to CP2, then 4FSC is sent to the SG-150 board. In addition, the INT H COM signal which was output from the SG-150 board is input to pin 10 of IC116, crosses internal drivers, is output from pin 9, crosses an LPF (R396, R397, C276, C277) and a buffer (Q132), then is returned to the SG-150 board. This DC is used to control the clock.

Moreover, the phase of the SC signal received from the SG-150 board can be changed at IC126 and IC127. During internal sync mode, however, IC120 enables the output of the SC signal to the encoder after its phase has been controlled by RV104. (The SC-H Adjustment)

### 2) VBS GEN-LOCK mode

A block diagram of operation in VBS GEN-LOCK mode is shown on the following page.

The EXT VBS signal initially enters the SYNC SEP circuit then is split into the SYNC and SC (chroma) signals. Phase deviation caused by the GEN-LOCK VBS cable is corrected by the cable corrector (C218, R320), ham noise is cancelled at the floating AMP formed by Q107, Q108, and Q109, the resulting signal then crosses the Q110 buffer, is clamped at D104, and enters the Q111 AMP. From Q111, the chroma component is sent from the emitter to the chroma AMP. The chroma component of the signal output from the Q111 collector is removed at the trap circuit formed by C229 and L106, then the remaining SYNC/Y signal is input to the Q112 buffer. The Q112 output is subjected to sync-gated and delayed at Q113 and Q114, and its backporch is clamped during the sync gate interval. Next, it crosses the Q116 buffer and an LPF formed by R349 and C236, enters the Q117 buffer from which it is output at 1/2 level due to the resistive voltage division of R351 and R352.

At the Q117 emitter, the AC portion of the signal is almost entirely lost. That is, the 1/2 level SYNC signal is input to pin 2 of the IC104 comparator. Because the clamped SYNC/Y signal is input to pin 3 of IC104, the GEN-LOCK signal will always be sliced to 50% of the SYNC signal for output of the SYNC pulse, regardless of the level of the GEN-LOCK signal. The SYNC pulse thus obtained is sent to the GEN-LOCK IC of IC116. In addition, only the SC (chroma) component of the Q111 emitter output is removed at the buffer formed by C240 and L108, the remaining signal is amplified at Q118, crosses the Q119 buffer, is limited to the CMOS input level by Q120 and Q121, then sent to IC116 by the Q122 buffer. At this point, to achieve internal synchronization with externally supplied SYNC and SC, the clock (H) loop and SC loop are locked.

In the H loop, the FH pulse received from the SG-150 board is input to the mono-stable multivibrator of IC125 and a pulse is generated from the falling edge of FH. The width of this pulse can be controlled by external DC control. Moreover, the output of pin 12 is fed back by the IC128 comparator to prevent changes in the pulse width due to fluctuations in the temperature. This pulse is input to IC116 where it is compared with an externally supplied SYNC and its output (pin 9) crosses an LPF formed by R396, R397, C276, and C277, and returns to the SG-150 board. Phase synchronization can thus be achieved by maintaining the internal H at a fixed phase with respect to external SYNC and by controlling the pulse width of IC125 (H shifter).

In the SC loop, the SC received from the SG-150 board is input to pin 18 of IC116 where it is compared with an externally supplied SC. At IC116, only the burst portion of the externally supplied chroma input is gated and compared with the internal SC. That output (pin 1) is removed at IC119 during the VD interval (the burst disappears during the V blanking interval, so the comparator output would be regarded as an error because there is nothing to compare during that interval), crosses an LPF formed by R404, R405, C284, and C285, is amplified at the IC132 OP AMP, then is input to the control voltage input of CP2 (4FSC VCO). (Approximately 3 V DC in locked status)

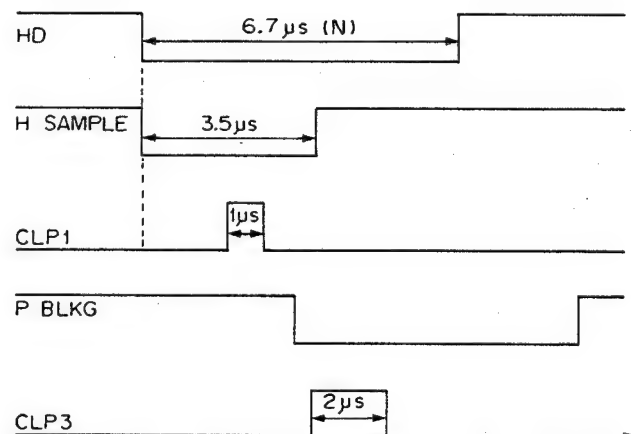

Next, the oscillated 4FSC is input to the sync generator IC of the SG-150 board, thus causing the internal SC to lock with the external SC (burst). The SC generated at the SG-150 board is sent to the encoder by the SC phase shifter formed by IC120, IC126, and IC127. The SC received from the SG-150 board is input to pin 2 of IC127 where its pulse width is amplified, then is output from pin 4. This pulse width can be controlled by external DC control. At such time, it will be fed back at IC126 and compensation for temperature fluctuations will be made.

That output is input to pin 10 of IC127, then is output at 50% duty (by Q and Q).

Consequently, the SC phase can be continuously varied by switching Q (pin 5) and Q (pin 12) in order to set the previously-mentioned pulse width to 0 or  $\pi$ . This enables the phase of SC output from the encoder to be synchronized with the external SC.

### (3) CLP1/CLP3/H SAMPLE/PRE BLKG generation circuit

The CLP1 and H SAMPLE pulses are generated by IC109. The HD signal received from the SG-150 board has its high-pass noise component cut off at an LPF formed by R427 and C298, then is input to pin 1 of IC109. Similarly, the VD signal received from the SG-150 board crosses an LPF formed by R428 and C299, then is input to pin 3 of IC109 and is reset during this interval. This negative pulse from a mono-stable multivibrator is sent to the PR-99 board as the H SAMPLE pulse. In addition, the output of pin 13 is delayed at R384 and C257, then input to pin 10 to form the CLP1 signal.

The CLP3 pulse and PRE BLKG pulses are both generated by IC107 and IC108. However, these pulses are similarly generated by HD input to pin 5 of IC108, and the end of the generated pulse is used as a trigger. The output of pin 6 is connected to pin 11, and the PRE BLKG signals are generated at that mono-stable multivibrator. Furthermore, the output of pin 7 is delayed at R380 and C253, is input to mono-stable multivibrator IC107 where the CLP3 signal is generated. The Reference pulse used at IE is also generated at IC107. At the fall of VD, a negative pulse is generated at IC107 which is input to the shift register of IC106, then CLP3 signals output as clock (pin 3) pulse which have been respectively shifted by 8H, 9H, and 10H. At IC105, the signal is NOR-ed with the PRE BLKG signal, and the resulting output is used as the Reference pulse.

## (4) BLKG generation circuit (only in NTSC mode)

BLKG GEN is formed by IC122, IC123, IC124, and D111 (NTSC).

The HD pulse received from the SG-150 board crosses the Q155 buffer and is input to pin 1 of IC122.

The H BLKG pulse, which is output from pin 4 of IC122, is AND-ed with the HD pulse at D111, then the result is supplied to pin 2 of IC124 as the H BLKG pulse.

The output of pin 13 of IC122 is again input to pin 9 of IC122 to generate the 1/2H pulse.

The 1/2H pulse is output from pin 5 of IC8 and is input to pin 5 of IC123.

IC123 is a 19/20/21H shifter and the selection of 19, 20, or 21H is achieved by S102.

The VD pulse and HD pulse received from the SG-150 board are respectively input to pin 6 and pin 4 of IC123.

The pulse output from pin 10 of IC123 is input to pin 5 of IC124.

The clocks which rise at the fall of the 1/2H pulse and at the rise of the HD pulse are internally generated at IC9. At IC123, the VD pulse is received and shifted on the basis of these clocks.

Next, the VD pulse and the shifted VD pulse are input to the R-S flip-flop (IC124) where the V BLKG pulse is generated.

At IC124, the V BLKG pulse is being generated.

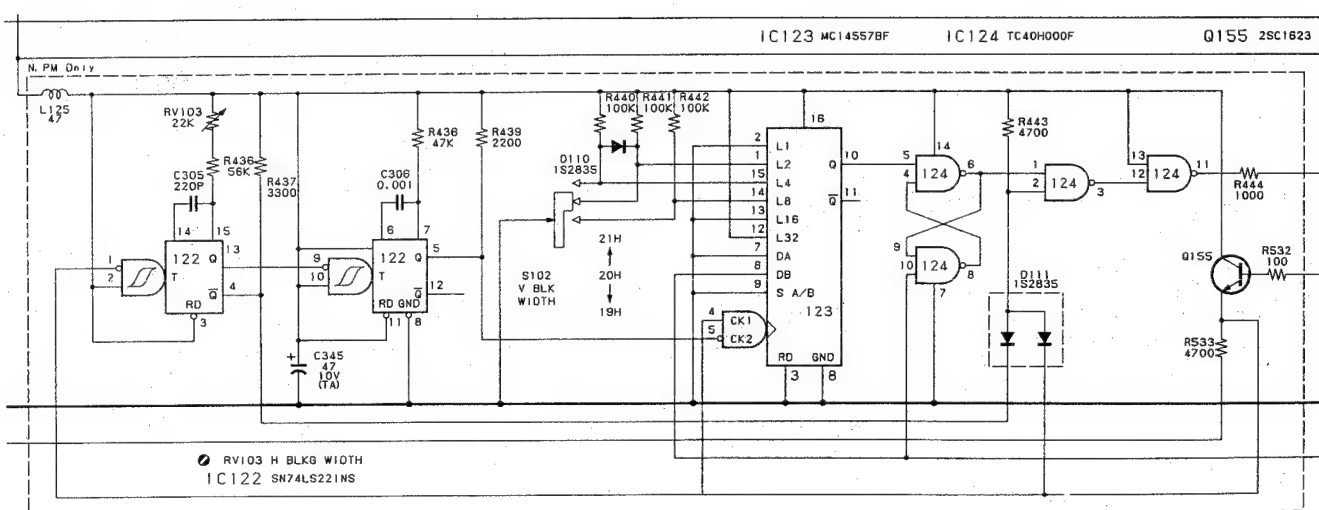

The H BLKG and V BLKG pulses are mixed at IC124, then output as the BLKG pulse to the PR-99 board and the encoder.

RV103 is a variable resistor used for adjusting the pulse width of the H BLKG pulse.

## (5) CLOCK/HD/VD/SYNC driver

With the DXC-750 (XC-007), it is possible to access the internally generated SYNC signals from the CCU's rear panel.

After the clocks are output from the SG-150 board, they are output by the driver formed by Q135 and Q136. The clock level is approximately 2.2 Vp-p (in terminated state). Although the same circuit is used for the HD, VD, and SYNC signals, the output from the SG-150 board is input to the inverter of IC121 and that inverter's output is output by the driver formed by Q138, Q139, and Q140. The signal level is approximately 4 Vp-p (in terminated state).

### <Encoder Circuit>

The R, G and B signals sent from the PR-99 board are input to the circuits generating the Y (luminance), I (V) and Q (U) signals respectively.

#### (1) Y signal circuit

The Y signal generated when the R, G, and B signals are mixed through R601, 602 and 603 passes the Q201-204 amplifier, and is output to TP201.

The SYNC pulse passes Q240 and Q241 of IC202 and is mixed through this amplifier. The proportion of R, G and B is determined by that of R601-R603.

The Y signal then passes the delay line (DL101) to match the phase with the chroma signal, and is input to the 75 ohm driver circuit.

#### (2) I (V) and Q (U) signal circuit

The I (V) signal is generated by R644, R645 and R646 and the Q219-Q221 differential amplifier, while the Q (U) signal is generated by R677-R682 and the Q232-Q234 differential amplifier. R653, L207, C416, C417, R689, L211, C440 and C441 compose a low-pass filter to limit the band.

The burst flag output from pin 12 of IC202 is mixed with the I (V) and Q (U) signals at Q222 and Q236 respectively after passing Q235, and is then input to IC201 of the modulator.

The carrier balance is adjusted by RV203 and RV209 which are equipped to vary the input DC bias to compensate the offset of IC201.

On IC201, the subcarrier whose phase has been shifted by 90° each at C431, C432 and LV1 is input to pin 15 and pin 3.

After being modulated with the I (V) and Q (U) signals, the burst plus chroma signal is output from pin 8. This signal passes the BPF (FL1) and is output into the Q225 and Q226 inverting amplifier. This chroma signal and the above mentioned Y signal are mixed in the Q207-Q213 75 ohm driver circuit. The level twice the normal level (1 Vp-p) is output to TP202.

For the NTSC model, the blanking pulse output from pin 8 of IC202 is mixed in this driver circuit, and its level is adjusted by RV210.

#### (3) Y/C OUT circuit

The Y (luminance) signal for the Y/C OUT is input to the Q214-Q218 75 ohm driver circuit from Q206, and at TP203 a Y signal of 2 Vp-p is output.

Similarly, the chroma signal is input to the Q227-Q231 75 ohm driver circuit from Q226, and at TP206 an 80IRE burst for NTSC model (or 600 mV for PAL model) is output.

The Y level is adjusted at RV202, and the chroma level is adjusted at RV205.

## 3-3. SG-150 Board

The SG-150 board is composed of the phase comparator in an HD.VD external sync mode, VCO, SYNC generator IC, and DELAYED HD circuits.

#### (1) SYNC generator, VCO

This unit operates in the following three sync modes:

- Internal sync
- VBS external sync
- HD.VD external sync

In internal sync mode, slight different operation occurs between NTSC system and PAL system.

VCO operation and the condition of terminals in each mode are as shown below.

#### NTSC

	CL X'tal	CL L • C	4FSC IN	INT/EXT	HV DET
INT	O	x	x	L	H
VBS	O	x	O	H	H
HD • VD	x	O	x	L	L

#### PAL

INT	O	O	O	L	H
VBS	O	O	O	H	H
HD • VD	x	x	x	L	L

Note: In INT mode of NTSC, the CL IN, which is divided into four by internal switch, is output from SC OUT of IC6 CX-7930.

When HV DET is H, the signal is input to pin 2 of IC7, and pin 3 is set to L, and Q6 is set to ON. Then the power voltage is added to X1, and the unit operates. The level of pin 4 is set to L so that LC VCO does not operate. When HV DET is set to L, Q6 is set to OFF. So X1 does not operate, but LC VCO operates. In this case, from pin 8 of IC7, no signal is output. The CL made here is sent to CX-7930A of IC6 to make sync pulses, and also sent to IC1.

There are three CL frequencies depending upon the model as shown below.

Model	CL frequency
DXC-750/750MD, XC-007	14.31818 MHz
XC-007P	14.1875 MHz
DXC-750P	14.7500 MHz

The signal is directly input to IC6 from JR5 for the DXC-750, XC-007 and XC-007P; for the DXC-750P, it is input to IC10 CXD1361, and the output signal is input to IC6 because of the aspect ratio of CCD. The aspect ratio of CCD used in the DXC-750P is different from the other ones so that the H pulses are thinned out. This IC stops the CL at the moment of thinning.

### (2) HS (DELAYED HD) circuit

This unit is a two-piece camera composed of a camera head and a CCU, and the circuit which aligns the phases of the head and CCU is placed on the SG-127 board. This circuit produces an HS pulse used as a reference pulse. The clock is divided into 8 by IC1, and is input to IC2 as a clock. HD, which is reversed by Q1, is also input to IC2. When the rising of the pulse is delayed by 6 bits of the clock of IC1 from the timing of HD, i.e.

$$70 \text{ ns} \times 8 \times 6 = 3.36 \mu\text{s}$$

an HS pulse is output. Actually, the clock is reset by using the HD pulse in IC1 so that the start of the clock of pin 12 is delayed by a half bit;

$$280 \text{ ns} + 70 \text{ ns} \times 8 \times 6 = 3.64 \mu\text{s}$$

The HS is delayed by about 3.6  $\mu\text{s}$  from HD. (The pulse width is calculated by  $6.7 \mu\text{s} - 3.64 \mu\text{s} = 3.06 \mu\text{s}$  in case of NTSC.)

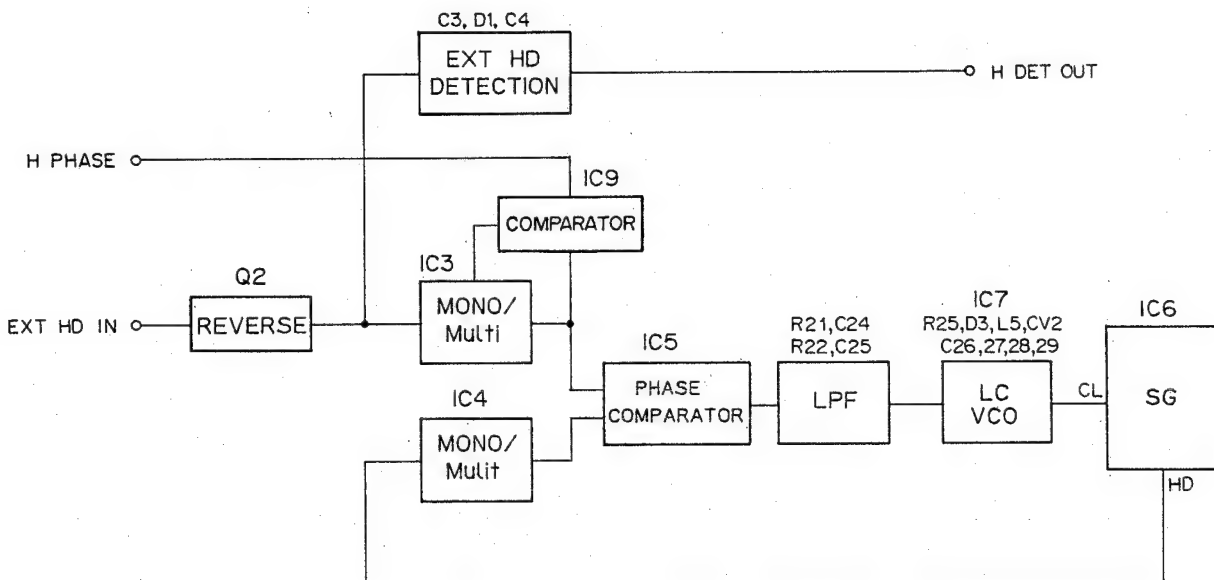

### (3) Phase comparator circuit in HD.VD external sync mode

When HD is input from the external equipment, it is reversed by Q2. Then it passes the buffer of Q7, is rectified by D1, and is held by C4. Therefore the H DET OUT becomes H.

The output of Q2 is input to IC3, and the negative pulse is made. The width of this pulse is adjusted by the DC (0 – 5 V) of CN4-1 H PHASE. Then the pulse is fed back by using the OP AMP of IC9 through pin 4 of IC3 to obtain stable temperature characteristics.

HD input from IC6 is reversed by Q4, and input to IC4. The pulse delayed a little from HD is output from IC4 (positive pulse from pin 5).

The end of the pulse of IC3 (rising edge) and the beginning of the pulse of IC4 (rising edge) are compared by the phase comparator of IC5, and the difference is output from pin 13. The output of pin 13 passes the LPF of R21, C24, R22 and C25, and is input to Q5 buffer, then input to LC VCO. The BUF OUT is DC, and the capacity of D3 changes according to the DC level, which changes the generated frequency. The clock made by LC VCO is input to IC6, where HD changes according to the change of the clock. As a result, the phases of two pulses input to IC5 are aligned, i.e., the output of IC6 keeps a constant phase relation with an external HD.

### 3-4. CHU

#### <PA board>

As the circuits of the PA-64, 65 and 66 boards are the same, here the PA-64 board only is described. For the PA-65 board, however, some reference numbers are different.

##### (1) CCD bias section

The vertical register transfer pulse generated in the DR-62 board is sent to pin 1-pin 3 and pin 6 of CCD, the V SUB voltage to pin 4, the VL voltage to pin 7 and pin 17, the +15 V to pin 10 and pin 15, and the PG pulse and the horizontal register transfer pulse to pin 16, pin 18 and pin 19 respectively. At pin 12, a voltage of approximately 2 V which is divided from +15 V is supplied.

##### (2) PA section

The CCD OUT signal input to the Q1 buffer from pin 11 of CCD is output to two circuits. On the one hand, the signal passes the Q2 buffer, and samples and holds the pre-charge level of the CCD output at Q3. Then it passes the Q4 and Q5 buffer and samples and holds the signal with the same phase as that of the signal. On the other hand, the CCD OUT signal which passed the Q8 buffer (Q11 for the PA-65 board) samples and holds the signal at Q9 (Q12), passes the Q10 (Q16) buffer and is input to the Q11 (Q17) differential amplifier.

Consequently, the difference level caused by the signal level input at Q11 (Q17) and that caused by the pre-charge level input at Q13 (Q19) are amplified, and this becomes the PA OUT signal after passing the Q15 (Q21) buffer. This CDS circuit reduces the reset noise and 1/f noise and contributes to a better signal-to-noise ratio. The gain of the differential amplifier is approximately 3.5 times for R and B, and approximately 2 times for G.

\* As the DXC-750 employs shifting of picture elements, sample-hold is performed on the PA-65 board (at Q9 and Q15) with the phase shifted from the signal phase by 1/2 pitch (35 ns), as well as in the above mentioned circuits.

#### <TG-33 board>

The TG-33 board is composed of a synchronizing circuit between the CHU and the CCU, CCD drive pulse generating circuit, shutter pulse generating circuit and MONITOR OUT circuit.

The H.pulse ( $\overline{H}$ ) input from the CCU is inverted at Q6.

The inverted pulse is input to the Q2 buffer and to pin 45 of IC1. After passing Q2, the pulse is returned to the CCU through pin 4 of CN3. On the other hand, when the H. pulse is input to pin 45 of IC1, the same pulse is output from pin 18. This pulse is compared with the H REF pulse output from pin 20 on the TG-35 board and the corresponding clock (28.5 MHz) is input to pin 32 of IC2. This clock, after being divided into 1/2, is input to pin 4 of IC1 to be used as the clock of IC1. At this step, the H REF pulse referred to the internal HD of IC1 is delayed by approximately 3.85  $\mu$ sec.

Since this pulse operates so that the phase matches the H. pulse (H SEP) input from the CCU, the HD output from IC1 is advanced to the H SEP by 3.85  $\mu$ sec.

The VD sent from the CCU is inverted twice at Q5 of IC7 and is input to pin 46 of IC1.

The IC2 is a generator of various CCD drive pulses. The IC selects NTSC/PAL, color/monochrome, field/frame, HD delay, etc. with the ROM of IC5, using the HD and VD from IC1 and the 28.5 MHz clock from the TG-35 board as reference, and outputs the pulses.

\* The IC3 is used to generate the pulse shifted from the SHD pulse by 1/2 pitch (35  $\mu$ sec), since the DXC-750 employs shifting of picture elements.

The IC4 is a shutter pulse generating IC. The VD is input to pin 1, HD to pin 1, XV4 to pin 3, XSG1 to pin 4 and PS to pin 5. The storage time is determined by the low or high state of pins 13, 14 and 15.

(table)

D2	D1	D0	SEC
L	L	H	1/125
L	H	L	1/250
L	H	H	1/500
H	L	L	1/1000
H	L	H	1/2000
H	H	L	1/4000
H	H	H	1/10000

IC4 Pin 15: D0  
Pin 14: D1  
Pin 13: D2

When the electronic shutter is OFF, pin 6 of IC4 is set to LOW and no shutter pulse is output.

The NTSC mode is selected when pin 7 is set to HIGH, and the PAL mode is selected when pin 7 is set to LOW.

When the G signal is sent to the Q3 base from the DR-62 board, the lower end is clipped by the ground potential to eliminate impulsive low levels for the blanking period. The clipped signal is mixed with the sync signal output from pin 48 of IC1 at Q4, and then output from the MONITOR OUT of the CHU.

#### <TG-35 board>

The H. REF and H. SEP pulses output from IC1 of the TG-33 board are compared on this board. The difference of the pulses passes the source follower of the Q6 LPF composed of R34, R35, C12 and C13, and is input to the C16-C20, R32 and R33 LC oscillator. This controls the frequency to eliminate the phase difference. The frequency is controlled by varying the capacity according to the voltage applied to D2.

#### <DR-61 board>

The DR-61 board is a horizontal register transfer pulse driving circuit. As the operation of the R, G and B channels is the same, here the circuit for one of the three channels is described.

The XH1 and XH2 pulses sent from the DR-62 board are input to pin 4 and pin 2 of IC respectively. The IC functions as the inverter and the driver and outputs the inverted pulses at pin 5 and pin 7. The pulses are C-cut and low-level clamped by the diode, and then are output to the PA board.

#### <DR-62 board>

The DR-62 board is composed of a vertical register transfer pulse driving circuit, PA OUT driving circuit and V SUB supply circuit.

##### (1) Vertical register transfer pulse driving circuit

The IC1 sends the pulse to B channel, and the IC2 sends the pulses to R channel and G channel.

The IC1 and IC2 are inverting drivers. When XV1 is input to pin 19, the inverted pulse is output from pin 2. The power for the inverter is supplied from pin 3. The XSG1 (one pulse to V) input to pin 20 is inverted and output from pin 1. The output pulse is low-level clamped to the DC supplied from the Q1 emitter at D2 and D6, and is input to pin 3.

The V1 OUT is, therefore, approximately +14 V when SG1 is at the present phase, and reads the electric charge from the CCD. Regarding the V3, a similar process is performed. The XSG2 is input to pin 20, and the inverted signal is output from pin 6. The inverted signal is clamped at D2 and D6 and input to pin 8. The V3 output at pin 7 is approximately +14 V at the current phase.

The V2 and V4 are input to pin 18 and pin 15, and output from pin 5 and pin 10 respectively.

The V1, V2, V3 and V4 IC outputs pass the capacitor, are low-level clamped at D3, D4, D7 and D8, pass the DR-61 board, and are sent to the PA board respectively.

The clamping potential used is a peak-rectified pulse of a similar pulse to the V4 (approximately -10V).

The PG pulse is supplied to each PA board by driving the XPG pulse input to pin 20 of CN1 through the Q3 to Q6 inverting driver.

##### (2) PA driving circuit

As the same circuit is used for three channels, here the R channel only is described.

The PA OUT signal which has passed the DR-61 board and has been input to R56 functions as the amplifier and 75 ohm driver at Q24-Q28.

The gain is  $1 + R52/R54 = 2$ . When the signal is transmitted from the CHU to CCU through a coaxial cable and terminated at 75 ohms on the CCU, the level is reduced by half. To compensate it, the 75 ohm driver amplifies the level twice.

##### (3) V SUB supply circuit

As the same circuit is used for three channels, here the R channel only is described.

When the Q13 base potential is to rise, the Q13 corrector potential lowers. Consequently the Q14 emitter potential decreases to lower the Q13 base potential for a constant potential (approximately +5 V). This circuit controls the Q14 emitter (= V SUB) by adjusting the variable resistor (base potential). When operating the electronic shutter, a shutter pulse is input to pin 14 of CN1 from the TG-33 board, and the 29 Vp-p pulse generated by the Q29-Q32 inverting driver is added to each V SUB through the capacitor.

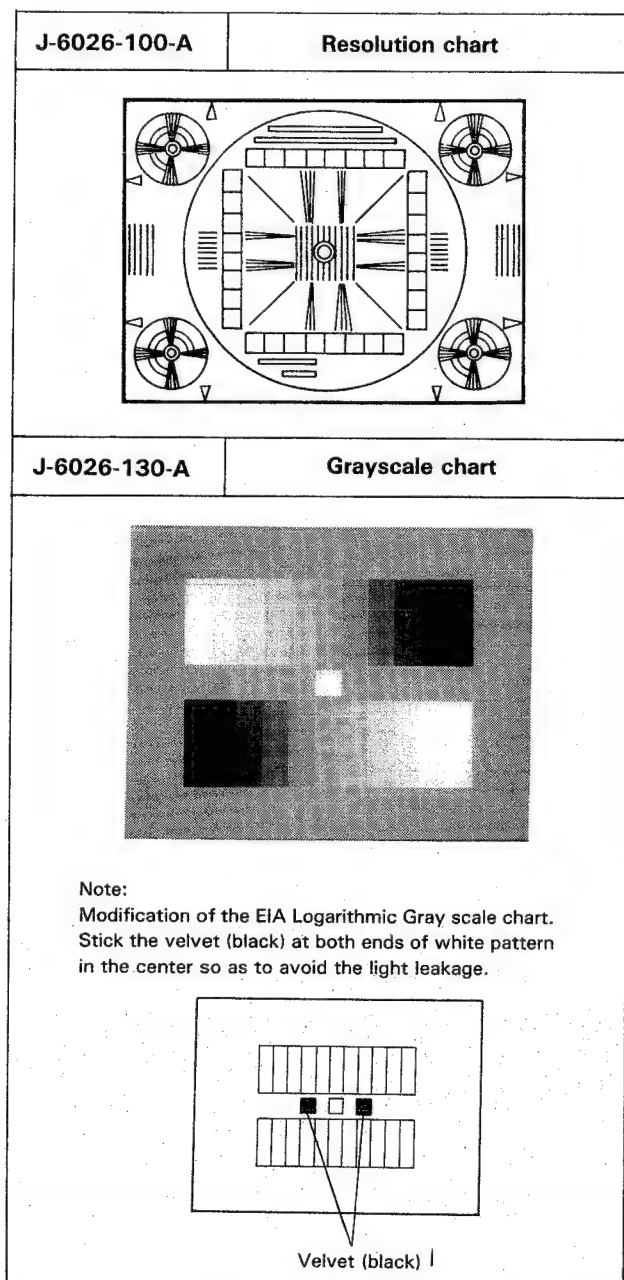

# CHAPTER 4 ALIGNMENT

## 4-1. PREPARATION

### 4-1-1. Equipment Required

- Oscilloscope (more than 30 MHz)
- Waveform monitor
- Vectorscope
- Black and white monitor (Sony PVM-91/91CE or equivalent)
- Color Monitor (Sony PVM-1320/1320P or equivalent)
- Frequency counter

## 4-1-2. Connections

### 4-1-3. Initial Setting

Set the switches and controls as follows.

- FRONT PANEL
  - COLOR TEMP : 3200K
  - W/B BALANCE
    - AUTO/MAN : AUTO
    - GAIN R, B : mechanical center
    - PED R, B : mechanical center
  - GAIN : 0 dB
  - MASTER PED : mechanical center
  - IRIS AUTO/MAN : MAN
    - (control) : mechanical center
  - SHUTTER ON/OFF : OFF
  - MODE : CAM
  - DETAIL : mechanical center
  - PHASE SC 0°/180° : 0°
    - SC, H : mechanical center

- REAR PANEL
  - RGB SYNC ON/OFF : ON
  - RGB2/COMPONENT : RGB2
  - GAMMA : ON
  - LINEAR MATRIX : OFF
  - GEN LOCK IN 75  $\Omega$   $\times$  3 : ON
  - CABLE COMP :  $\sim$ 10

- PR-99 Board
  - S1 OFF/ON : OFF (DXC-750/P, XC-007/P)  
ON (DXC-750MD)
  - S101 ADJ/OPE : ADJ

- SG-127 Board
  - S1 HF DTL : ON
  - S101 FIELD INV : NORMAL
  - S102 V BLKG WIDTH : 20H (XC-007, DXC-750/MD)

After adjustment, set the switches as follows.

- FRONT PANEL
  - IRIS AUTO/MAN : AUTO
- REAR PANEL
  - LINEAR MATRIX : ON (DXC-750/MD/P)  
OFF (XC-007/P)
- PR-99 Board
  - S101 ADJ/OPE : OPE

PR-99 board (component side)

SG-127 board (component side)

## 4-2. BEFORE ADJUSTMENT

- Note: 1. Before adjustment, connect the equipments referring to 4-1-2 Connections. And confirm that the following specifications are satisfied.
2. Before adjustment, set the POWER switch to ON and warm up for about 10 minutes.

### 4-2-1. Color bar signal

Equipment: Vectorscope, Waveform monitor

Preparation: Set the MODE switch to BARS

Specifications:

(NTSC)

Chroma level

- Adjust so that the beam spots of each color (R, YL, G, CY, B, and MG) are inside the "田" mark.

Note: Partial difference between scale and signal level is caused by photographic error.

Burst spot 75%

Note: When the specifications are not satisfied, carry out 4-4 ENCODER SYSTEM.

(PAL)

Y level  $700 \pm 15$  mV

SYNC level  
 $300 \pm 15$  mV

Note: Partial difference between scale and signal level is caused by photographic error.

Chroma level

- Adjust so that the beam spots of each color (R, YL, G, CY, B, and MG) are inside the "E" mark.

Burst spot 75%

Note: When the specifications are not satisfied, carry out 4-4 ENCODER SYSTEM.

#### 4-2-2. Sensitivity measurement

Object: White pattern  
Lighting: 3200°K, 2000 lux  
(If the pattern box "PTB-100" is used, set the AUTO mode to "706 Nit")

Preparation:

1. Adjust the zoom control at "TELE" so that the white pattern frame touches the underscanned picture frame on the screen.
2. Manually set the iris control to F5.0~5.6 (NTSC)/F4.0~5.0 (PAL)
3. Perform the automatic white balancing.

Equipment: Waveform monitor

Specifications: Adjust so that the white level is  $100 \pm 2$  IRE (NTSC)/ $700 \pm 15$  mV (PAL).

Note: When the specification is not satisfied, perform all adjustments in 4-5, VIDEO PROCESS SYSTEM.

#### 4-2-3. Gamma and gradation measurement

Object: Grayscale chart  
(Sony parts number J-6026-130-A)

Light: Pattern box PTB-100/500

Equipment: Waveform monitor

Preparation:

1. Adjust the zoom control so that the Grayscale chart frame touches the underscanned picture frame on the monitor.
2. Adjust the iris control so that the white level of Grayscale chart is 100 IRE (NTSC)/700 mV (PAL) on the waveform monitor.

Specification: Adjust so that the cross point level of the grayscale chart is  $58 \pm 2$  IRE (NTSC)/ $385 \pm 15$  mV (PAL).

Note: Partial difference between signal level and scale is caused by a photographic error.

Note: When the specification is not satisfied, carry out 4-5-7 G ch Gamma Balance and Gamma Set Adjustment.

#### 4-2-4. Resolution measurement

Object: Resolution chart  
(Sony parts number J-6026-100-A)

Light: Pattern box PTB-100/500

Equipment: Waveform monitor

Preparation:

1. Adjust the zoom control so that the resolution chart frame touches the underscanned frame on the monitor.
2. Adjust the iris control so that the white level of the resolution chart is 80 IRE (NTSC)/560 mV (PAL) on the waveform monitor.
3. Adjust the focus control so that the amplitude "A" of the resolution chart is maximized.
4. Set the "LINE SELECTOR" of the waveform monitor to the 700 TV lines (DXC-750/MD/P), 570 TV lines (XC-007), or 560 TV lines (XC-007P) of the resolution chart.

Specification: Four negative peaks corresponding to four black stripes must appear at the 700 TV lines (DXC-750/MD/P), 570 TV lines (XC-007), or 560 TV lines (XC-007P) position "B" of the resolution chart on the monitor.

The CCD device has 768 (756) picture elements in the horizontal line. When the vertical black stripes corresponding to 700 TV lines (or 570/560 TV lines) are optically positioned between each element in the CCD, the black stripes do not appear on the monitor. It seems that the resolution has been reduced. In this case, pan the camera slightly so that the best resolution is obtained.

### 4-3. SYNC SIGNAL SYSTEM

#### 4-3-1. Sub carrier frequency adjustment

Equipment: Frequency counter  
 Test point: TP104 (GND: E102)/SG-127 board  
 Adjustment point: RV102/SG-127 board  
 Specification:  $3,579,545 \text{ Hz} \pm 5 \text{ Hz}$  (NTSC)  
 $4,433,618 \text{ Hz} \pm 5 \text{ Hz}$  (PAL)

#### 4-3-2. CHU-CCU phase adjustment

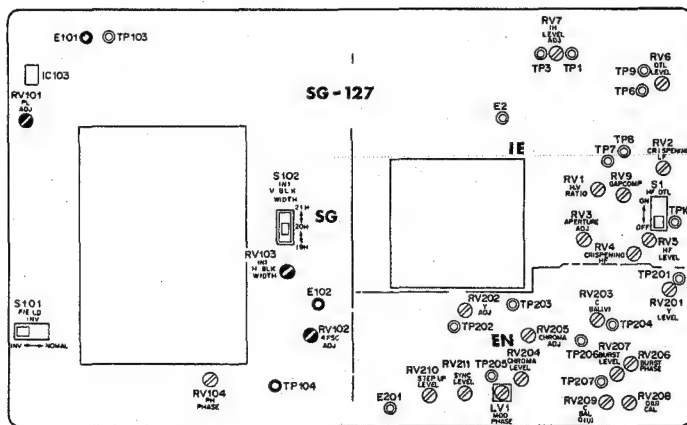

Equipment: Oscilloscope  
 Test point: TP108/IC103 pin 3 (GND: E101)/SG-127 board  
 Adjustment point: RV101/SG-127 board  
 Specification:  $2.6 \pm 0.1 \text{ V dc}$

### 4-4. ENCODER SYSTEM

#### 4-4-1. Blanking pulse width (only NTSC)

Object: White pattern  
 Equipment: Waveform monitor  
 Adjustment:

1. Adjust the zoom control at TELE so that the white pattern frame touches the underscanned picture frame on the screen.
2. Adjust the iris control so that the white level is 70 IRE.
3. Adjust RV103/SG-127 board so that blanking pulse width is  $10.9 \pm 0.1 \mu\text{s}$ .

SG-127 board (component side)

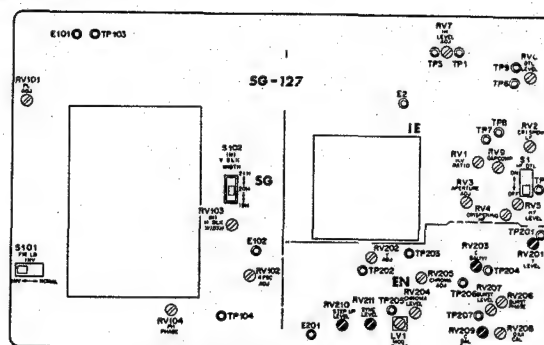

**Adjustment:** Adjust ① RV203 and ② RV209/SG-127 board so that the white beam spot is in the center of the vectorscope.

1. Adjust  $\odot$  RV211/SG-127 board so that the SYNC level of the color bars signal is  $40 \pm 2$  IRE (NTSC)/ $300 \pm 15$  mV (PAL).
2. Adjust  $\odot$  RV210/SG-127 board so that the SET UP level of the color bars signal is  $7.5 \pm 0.5$  IRE. (only NTSC)
3. Adjust  $\odot$  RV201/SG-127 board so that the Y level of the color bars signal is  $77 \pm 2$  IRE (NTSC)/ $700 \pm 15$  mV (PAL).

4. Repeat steps 1 to 3 several times until the specifications are satisfied.

4-10

DXC-750/MD/P  
XC-007/P

Ve = 0.07 = 0.0071

#### 4-4-6. Color bar width adjustment

Equipment: Oscilloscope

Preparation: Set the MODE switch to BARS.

Test point: VIDEO OUT (BNC)

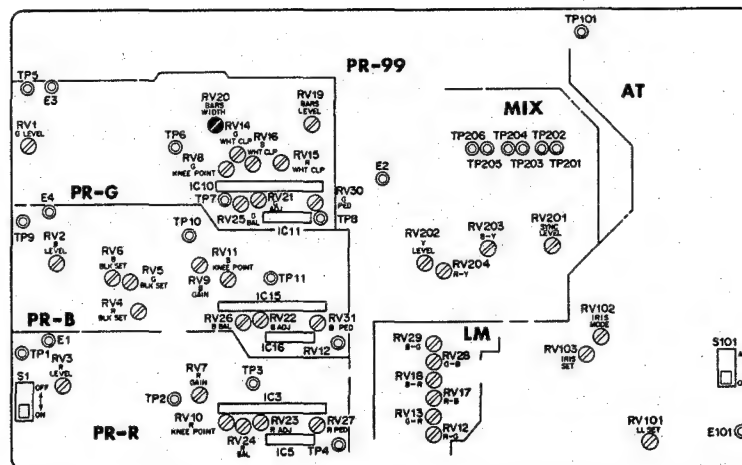

Trigger: HD

Adjustment: Adjust  $\odot$  RV20/PR-99 board so that the black level width of the color bar signal is  $4.0 \pm 0.2 \mu\text{s}$  (NTSC)/ $5.3 \pm 0.2 \mu\text{s}$  (PAL).

(NTSC)

(PAL)

PR-99 board (component side)

#### 4-4-7. RGB-SYNC Level adjustment

Equipment: Oscilloscope

Preparation: Set the MODE switch to BARS.

Test point: TP203 (GND: E2)/PR-99 board

Trigger: HD

Adjustment:

Adjust  $\text{RV201/PR-99}$  so that the SYNC level is  $570 \pm 15 \text{ mV}$  (NTSC)/ $600 \pm 15 \text{ mV}$  (PAL).

#### 4-4-8. Component Y Level adjustment

Note: Before this adjustment, carry out 4-4-5. Color vector adjustment.

Equipment: Oscilloscope

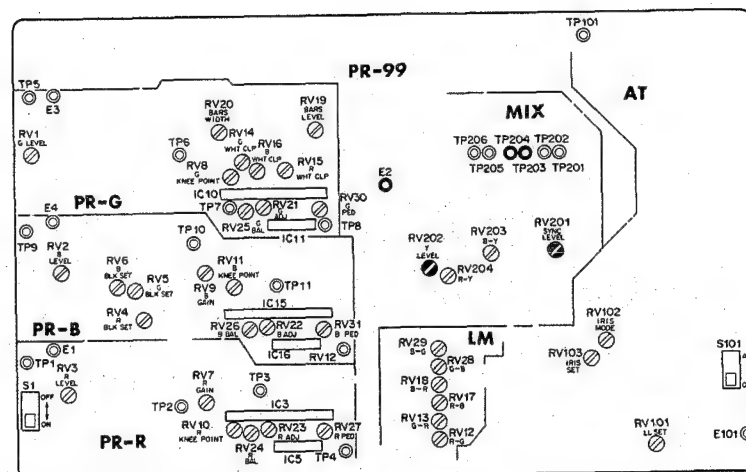

Preparation: Set the MODE switch to BARS.

Set RGB2/COMPONENT switch on the rear panel to COMPONENT

Test point: TP204 (GND: E2)/PR-99 board

Adjustment:

Adjust  $\text{RV202/PR-99}$  board so that the white level of Y + SYNC signal is  $1.67 \text{ V} \pm 20 \text{ mV}$  (NTSC)/ $2 \text{ V} \pm 20 \text{ mV}$  (PAL).

PR-99 board (component side)

#### 4-4-9. Component B-Y Level adjustment

Note: Before this adjustment, carry out 4-4-5. Color vector adjustment.

Equipment: Oscilloscope

Preparation: Set the MODE switch to BARS.

Set the RGB2/COMPONENT switch on the rear panel to COMPONENT.

Test point: TP206 (GND: E2)/PR-99 board

Adjustment:

Adjust  $\odot$  RV204/PR-99 board so that the B-Y level is  $1.4 \text{ V} \pm 30 \text{ mVp-p}$  (NTSC)/ $1.05 \text{ V} \pm 30 \text{ mV}$  (PAL).

#### 4-4-10. Component R-Y Level adjustment

Note: Before this adjustment, carry out 4-4-5. Color vector adjustment.

Equipment: Oscilloscope

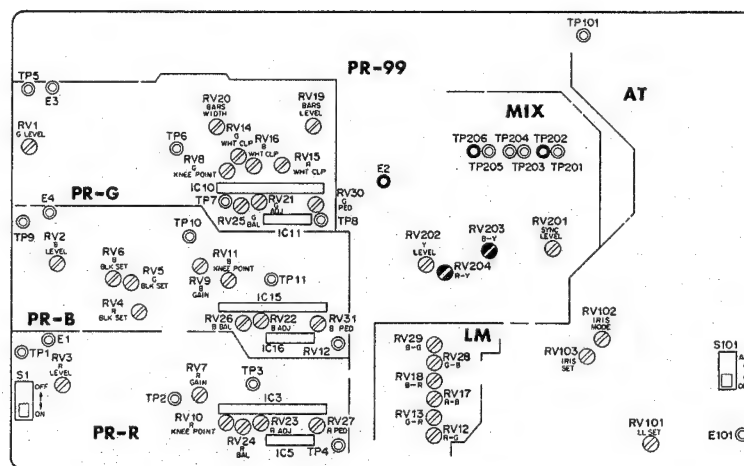

Preparation: Set the MODE switch to BARS.

Set the RGB2/COMPONENT switch on the rear panel to COMPONENT.

Test point: TP202 (GND: E2)/PR-99 board

Adjustment:

Adjust  $\odot$  RV203/PR-99 board so that the R-Y level is  $1.4 \text{ V} \pm 30 \text{ mVp-p}$  (NTSC)/ $1.05 \text{ V} \pm 30 \text{ mV}$  (PAL).

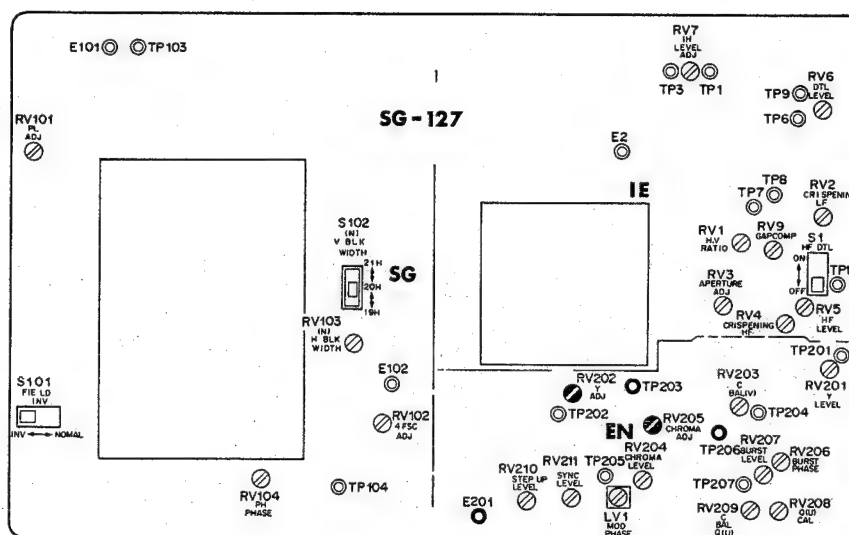

PR-99 board (component side)

SG-127 board (component side)

## 4-5. VIDEO PROCESS SYSTEM

### 4-5-1. IE•AGC gain adjustment

Object: White pattern  
Equipment: Oscilloscope  
Trigger: VD  
Adjustment:

1. Adjust the zoom control so that the white pattern frame touches the underscanned picture frame on the monitor.

Monitor screen

2. Set the lens iris so that the video level at TP1/SG-127 board is  $500 \pm 10$  mV.
3. Adjust the RV7/SG-127 board so that the video level at TP3/SG-127 board is  $500 \text{ mV} \pm 10$  mV.

### 4-5-2. G ch video level adjustment

Object: White pattern  
Equipment: Oscilloscope  
Test point: TP5 (GND: E3)/PR-99 board  
Trigger: VD  
Adjustment:

1. Adjust the zoom control so that the white pattern frame touches the underscanned picture frame on the screen.

Monitor screen

2. Set the lens iris so that the video level at TP5/PR-99 board is  $300 \pm 5$  mV (iris F  $\approx 5.6$  (NTSC), F  $\approx 5.0$  (PAL)).

Note: When the iris control is set from 5.6 (5.0) to open, confirm the brightness of the pattern box (PTB-100/500).

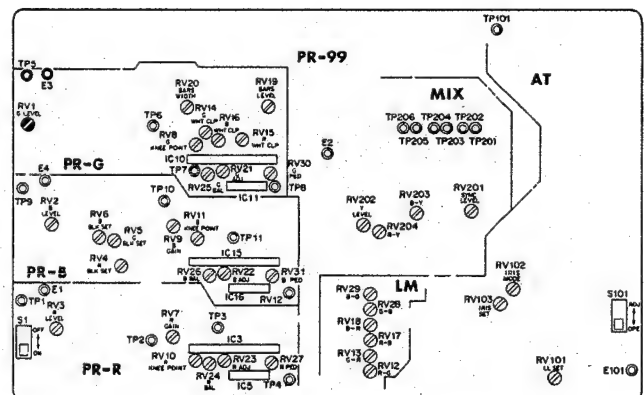

3. Adjust RV1/PR-99 board so that the video level at TP7/PR-99 board is  $650 \text{ mV} \pm 10$  mV.

Note: Carry out this adjustment through 4-5-4. R ch video level adjustment keeping the iris control set to F5.6 (NTSC), F5.0 (PAL).

SG-127 board (panel side)

PR-99 board (component side)

#### 4-5-3. B ch video level and pre-gain adjustment

Note: Be sure to carry out 4-5-2. G ch video level adjustment before this adjustment.

Object: White pattern

Equipment: Oscilloscope

Trigger: VD

Adjustment:

1. Adjust the zoom control so that the white pattern frame touches the underscanned picture frame on the monitor.

Monitor screen

2. Adjust RV2/PR-99 board so that the video level at TP-10 on the PR-99 board is  $200 \pm 5$  mV.

3. Adjust RV9/PR-99 board so that video level at TP11/PR-99 board is  $650 \pm 10$  mV.

#### 4-5-4. Rch video level and pre-gain adjustment

Note: Be sure to carry out 4-5-3. B ch level adjustment before this adjustment.

Object: White pattern

Equipment: Oscilloscope

Test point: TP2 (GND;E1)/PR-99 board

Trigger: VD

Adjustment:

1. Adjust the zoom control so that the white pattern frame touches the underscanned picture frame on the screen.

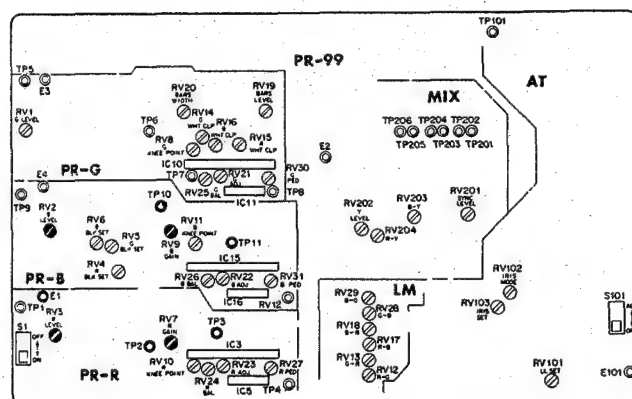

Monitor screen

2. Adjust RV3/PR-99 board so that the video level at TP 2/PR-99 board is  $200 \text{ mV} \pm 5 \text{ mV}$ .

3. Adjust RV7/PR-99 board so that the video level at TP 3/PR-99 board is  $650 \text{ mV} \pm 10 \text{ mV}$ .

PR-99 board (component side)

#### 4. ALIGNMENT

**Equipment:** Oscilloscope

Test point: TP 9 (GND: E2)/SG-127 board

Trigger: HD

Adjustment:

1. Adjust  RV9/SG-127 board so that the level shown as A is minimized less than 10 mV.

SG-127 board (component side)

#### 4-5-6. Black set and pedestal adjustments

Lens iris: Close "C"

Equipment: Oscilloscope, Vectorscope (MAX GAIN)

Test point: TP 8 (GND: E2)/PR-99 board (Connect a 10 K ohm resistor between the oscilloscope probe and TP 8)

Trigger: VD

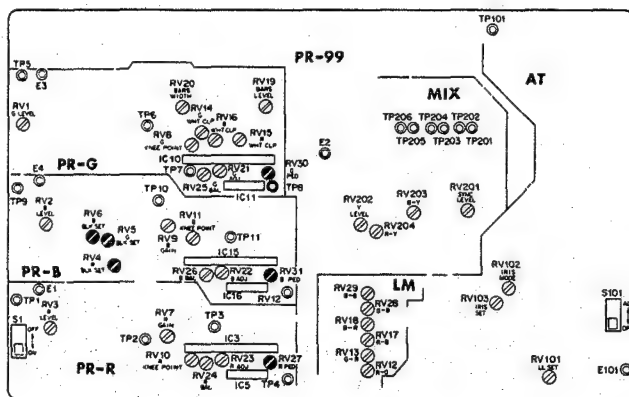

Adjustment:

1. Adjust  $\text{RV5}$ /PR-99 board so that pedestal level does not change when the GAIN switch on the front panel is switched over from 0 dB to 18 dB.

2. Set the GAIN switch to 0 dB.

3. Adjust  $\text{RV30}$ /PR-99 board so that the pedestal level is  $30 \pm 5$  mV.

PR-99 board (component side)

4. Set the GAIN switch to 18 dB.

5. Adjust  $\text{RV4}$   $\text{RV6}$  on the PR-99 board so that the beam spot is in the center of the vectorscope.

6. Set the GAIN switch to 0 dB.

7. Adjust  $\text{RV27}$  and  $\text{RV31}$ /PR-99 board so that the beam spot is in the center of vectorscope.

8. Repeat step 4 through step 7 several times.

9. Set the GAIN switch to 0 dB.

#### 4-5-7. G ch gamma balance and gamma set adjustment

Object: Grayscale chart

Equipment: Oscilloscope

Test point: TP 8 (GND: E3)/PR-99 board

Trigger: HD

Adjustment:

1. Adjust the zoom control so that the grayscale chart frame touches the underscanned picture frame on the monitor.

Monitor screen

2. Adjust the iris control so that the video level is 100 IRE (NTSC)/700 mV (PAL) on the waveform monitor.

3. Adjust  $\odot$  RV25/PR-99 board so that the white level of the video signal does not change when GAMMA switch on the rear panel is turned either ON or OFF.

GAMMA:  
OFF

GAMMA:  
ON

A = B

4. Adjust  $\odot$  RV21/PR-99 board so that the crosspoint level of the video signal is  $770 \text{ mV} \pm 10 \text{ mV}$ .

PR-99 board (component side)

#### 4-5-8. R ch gamma balance adjustment

Object: Grayscale chart  
 Equipment: Oscilloscope  
 Test point: TP 4 (GND: E1)/PR-99 board  
 Trigger: HD  
 Adjustment:

1. Adjust the zoom control so that the grayscale chart frame touches the underscanned picture frame on the monitor.

Monitor screen

2. Adjust the lens iris control so that the white level is 100 IRE (NTSC)/700 mV (PAL) on the waveform monitor.

3. Adjust  $\odot$  RV24/PR-99 board so that the white level of the video signal at TP 4/PR-99 board does not change when GAMMA switch on the rear panel is turned either ON or OFF.

DXC-750/MD/P  
 XC-007/P

A=B

#### 4-5-9. B ch gamma balance adjustment

Object: Grayscale chart  
 Equipment: Oscilloscope  
 Test point: TP 12 (GND: E4)/PR-99 board  
 Trigger: HD  
 Adjustment:

1. Adjust the zoom control so that the Grayscale chart frame touches the underscanned picture frame on the monitor.

Monitor screen

2. Adjust the iris control so that the video level is 100 IRE on the waveform monitor.

3. Adjust  $\odot$  RV26/PR-99 board so that the white level of the video signal at TP12/PR-99 board does not change when GAMMA switch on the rear panel is turned either ON or OFF.

A=B

#### 4-5-10. R/B ch gamma set and preset adjustment

Object: Grayscale chart

Equipment: Waveform monitor, Vectorscope (MAX GAIN)

Adjustment:

1. Adjust the zoom control so that the grayscale chart frame touches the underscanned picture frame on the monitor.

Monitor screen

2. Adjust the iris control so that the video level is 100 IRE (NTSC)/700 mV (PAL) on the waveform monitor.

100 IRE (NTSC)  
700 mV (PAL)

3.
  - RV 7 (R GAIN)
  - RV 9 (B GAIN)
  - RV 23 (R<sub>y</sub> ADJ)
  - RV 22 (B<sub>y</sub> ADJ) } /PR-99 board

Alternately adjust the above four controls several times so that the beam spot is in the center of vectorscope.

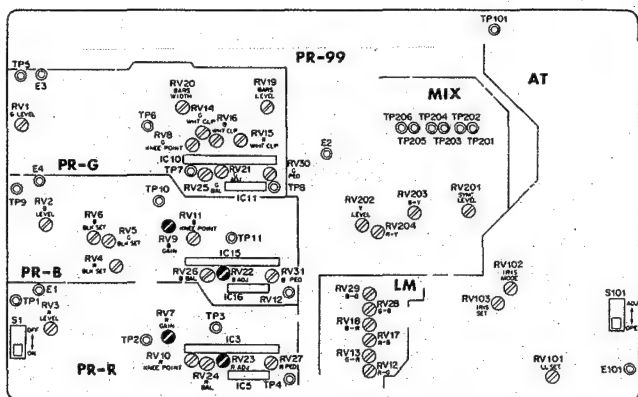

4. After the adjustment, the following specifications must be satisfied.

If not, perform from 4-5-2. G ch video level adjustment once more.

100 ± 2 IRE (NTSC)  
700 ± 15 mV (PAL)

58 ± 2 IRE (NTSC)  
385 ± 15 mV (PAL)

PR-99 board (component side)

#### 4-5-11. Pre knee adjustment

Object: Grayscale chart  
Equipment: Waveform monitor  
Adjustment:

1. Adjust the zoom control so that the grayscale chart frame touches the underscanned picture frame on the monitor.

Monitor screen

2. Set the lens iris so that the white level is  $110 \pm 2$  IRE (NTSC)/ $770 \pm 15$  mV (PAL) on the waveform monitor.

3. Adjust RV8/PR-99 board so that the white peak level starts to drop.
4. Open the iris control.
5. Adjust RV10, RV11/PR-99 board so that the carrier leakage of the white peak is minimized less than 3 IRE.

#### 4-5-12. White clip adjustment

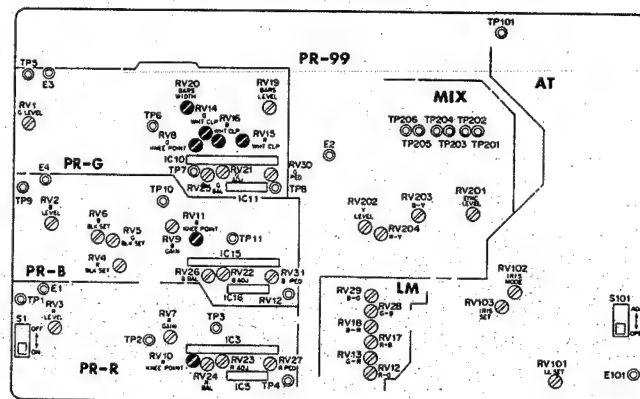

Object: Grayscale chart  
Equipment: Waveform monitor  
Adjustment:

1. Adjust the zoom control so that grayscale chart frame touches the underscanned picture frame on the monitor.

Monitor screen

2. Set the iris control to OPEN.
3. Adjust RV15 and RV16/PR-99 board several times so that the carrier leakage of the white peak level is minimized.
4. Adjust RV14/PR-99 board so that the white peak level is  $115 \pm 2$  IRE (NTSC)/ $800 \pm 15$  mV (PAL) on the waveform monitor.

PR-99 board (component side)

## 4-6. IMAGE ENHANCER SYSTEM ADJUSTMENT

Note: It is not necessary to adjust  $\odot$  CV1,  $\odot$  CV2,  $\odot$  CV3,  $\odot$  RV3,  $\odot$  RV4,  $\odot$  RV5/SG-127 board unless these controls are replaced.  
Do not touch these controls.

### 4-6-1. Crispening adjustment

Object: Grayscale  
Equipment: Oscilloscope  
Preparation: Rotate  $\odot$  RV2 (H/V RATIO)/SG-127 board fully clockwise  
Test point: TP8 (GND: E2)/SG-127 board  
Trigger: HD  
Adjustment:

1. Adjust the zoom control so that the grayscale chart frame touches the underscanned picture frame on the monitor.

Monitor screen

2. Adjust the iris control so that the video level is  $80 \pm 2$  IRE (NTSC)/ $560 \pm 15$  mV (PAL) on the waveform monitor.

3. Adjust  $\odot$  RV2/SG-127 board so that the level of A at TP8/SG-127 board is  $40 \pm 5$  mV. Connection of a 10 K ohm resistor between the oscilloscope probe and TP8 makes it easier to detect noise.

### 4-6-2. H.V.RATIO adjustment

Object: Gray scale  
Equipment: B/W monitor screen  
Preparation: Rotate  $\odot$  RV6 (DTL LEVEL)/SG-127 board fully clockwise

Adjustment:

1. Set the zoom control at TELE and shoot the grayscale chart.

Monitor screen

2. Adjust the iris control so that the video level is  $80 \pm 2$  IRE (NTSC)/ $560 \pm 15$  mV (PAL) on the waveform monitor.
3. Keep an eye on the white portion on the grayscale chart and adjust  $\odot$  RV1/SG-127 board so that the H and V detail volume is balanced.

Monitor screen

Figure 2. The effect of the concentration of the *Agaricus bisporus* spores on the growth of *Agaricus bisporus* on the substrate. The concentration of the spores was 10<sup>4</sup>, 10<sup>5</sup>, 10<sup>6</sup>, 10<sup>7</sup>, 10<sup>8</sup>, 10<sup>9</sup>, 10<sup>10</sup>, 10<sup>11</sup>, 10<sup>12</sup>, 10<sup>13</sup>, - 500 mV

# DECLARATION

- 
- The diagram shows a 16-bit bus system. It consists of two 16-bit registers, each represented by a horizontal rectangle divided into 16 vertical slots. A 3-bit control bus, represented by a horizontal rectangle divided into 3 vertical slots, is connected to the two registers. The control bus is positioned between the two registers, with its left and right slots connected to the left and right registers, and its middle slot connected to the middle register.

Monitor screen

2. Adjust the iris control so that the video output level is  $80 \pm 2$  IRE on the waveform monitor.
3. Set the DETAIL knob on the front panel fully clockwise.
4. Adjust RV6/SG-127 board so that the smaller detail level at both ends of the white level is  $80 \pm 15$  mV.
5. Set the DETAIL knob mechanical center.

#### 4. ALIGNMENT

Object: Grayscale chart  
Equipment: Waveform monitor  
Adjustment point: ② RV101/PR-99 board  
Adjustment:

- 

2. Adjust the lens iris control so that the white level of the video signal is  $43 \pm 2$  IRE (NTSC)/ $300 \pm 15$  mV (PAL).

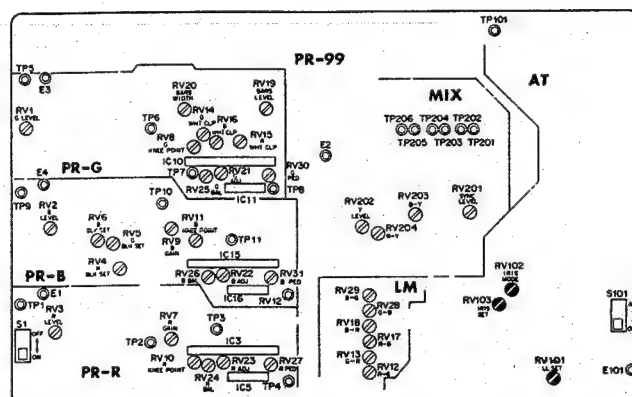

- 

Monitor screen

- Object: Grayscale chart  
Equipment: Waveform monitor  
Preparation: Set the IRIS switch to AUTO.  
Rotate  RV102 (IRIS MODE)/PR-99 board  
fully clockwise .

- Adjustment:
1. Adjust the zoom control so that the grayscale chart frame touches the underscanned picture frame on the monitor.

2. Adjust  $\odot$  RV103 (IRIS SET)/PR-99 board so that the white peak level "A" is  $90 \pm 2$  IRE (NTSC)/ $630 \pm 15$  mV (PAL).
3. Adjust  $\odot$  RV102 (IRIS MODE)/PR-99 board so that the white peak level "A" is  $100 \pm 2$  IRE (NTSC)/ $700 \pm 15$  mV (PAL).

注意:

- DC電圧はデジタル電圧計(入力インピーダンス10MΩ)による値。
- 波形写真及びDC電圧は下記条件で測定。

・フロントパネル

COLOR TEMP : 3200K  
 W/B BALANCE AUTO/MAN : AUTO  
 GAIN : 0dB  
 MASTER PED : 中央位置  
 IRIS AUTO/MAN : AUTO  
 GAIN : 0dB  
 SHUTTER ON/OFF : OFF  
 MODE : CAM  
 DETAIL : 中央位置  
 PHASE SC 0/180 : 0

・リアパネル

GAMMA : ON  
 LINEAR MATRIX : ON

・カラーバーを撮影

YEL	CYAN	GRN	WHT	MAG	RED	BLUE
-----	------	-----	-----	-----	-----	------

NOTE:

- All voltage are dc, measured with a digital voltmeter. (input impedance : 10MΩ)
- All waveforms are taken and DC voltage is measured in condition below.

・FRONT PANEL

COLOR TEMP : 3200K  
 W/B BALANCE AUTO/MAN : AUTO  
 GAIN : 0dB  
 MASTER PED : mechanical center  
 IRIS AUTO/MAN : AUTO  
 GAIN : 0dB  
 SHUTTER ON/OFF : OFF  
 MODE : CAM  
 DETAIL : mechanical center  
 PHASE SC 0/180 : 0

・REAR PANEL

GAMMA : ON  
 LINEAR MATRIX : ON

・Shoot the color bar chart

YEL	CYAN	GRN	WHT	MAG	RED	BLUE

注意:

- DC電圧はデジタル電圧計(入力インピーダンス10MΩ)による値。
- 波形写真及びDC電圧は下記条件で測定。

・フロントパネル

COLOR TEMP : 3200K  
 W/B BALANCE AUTO/MAN : AUTO  
 GAIN : 0dB  
 MASTER PED : 中央位置  
 IRIS AUTO/MAN : AUTO  
 GAIN : 0dB  
 SHUTTER ON/OFF : OFF  
 MODE : CAM  
 DETAIL : 中央位置  
 PHASE SC 0/180 : 0

・リアパネル

GAMMA : ON  
 LINEAR MATRIX : ON

・カラーバーを撮影

YEL	CYAN	GRN	WHT	MAG	RED	BLUE
-----	------	-----	-----	-----	-----	------

NOTE:

- All voltage are dc, measured with a digital voltmeter. (input impedance: 10MΩ)
- All waveforms are taken and DC voltage is measured in condition below.

・FRONT PANEL

COLOR TEMP : 3200K  
 W/B BALANCE AUTO/MAN : AUTO  
 GAIN : 0dB  
 MASTER PED : mechanical center  
 IRIS AUTO/MAN : AUTO  
 GAIN : 0dB  
 SHUTTER ON/OFF : OFF  
 MODE : CAM  
 DETAIL : mechanical center  
 PHASE SC 0/180 : 0

・REAR PANEL

GAMMA : ON  
 LINEAR MATRIX : ON

・Shoot the color bar chart

YEL	CYAN	GRN	WHT	MAG	RED	BLUE
-----	------	-----	-----	-----	-----	------

NOTE :

1. All voltage are dc, measured with a digital voltmeter, (input impedance : 10MΩ)
2. All waveforms are taken and DC voltage is measured in condition below.

• FRONT PANEL

COLOR TEMP	: 3200K
W/B BALANCE AUTO/MAN	: AUTO
GAIN	: 0dB
MASTER PED	: mechanical center
IRIS AUTO/MAN	: AUTO
GAIN	: 0dB
SHUTTER ON/OFF	: OFF
MODE	: CAM
DETAIL	: mechanical center
PHASE SC 0/180	: 0

• REAR PANEL

GAMMA	: ON
LINEAR MATRIX	: ON

• Shoot the color bar chart

YEL	CYAN	GRN	WHT	MAG	RED	BLUE
-----	------	-----	-----	-----	-----	------

注意 :

1. DC電圧はデジタル電圧計(入力インピーダンス10MΩ)による値。
2. 波形写真及びDC電圧は下記条件で測定。

• フロントパネル

COLOR TEMP	: 3200K
W/B BALANCE AUTO/MAN	: AUTO
GAIN	: 0dB

### REPAIR PARTS

## 7-1. MECHANICAL PARTS LIST

### 7-1-1. Camera Head Unit

No.	Parts No.	Description
1	A-7501-057-A	CHU ASSY, SERVICE
2	*X-3726-908-1	CABINET ASSY
3	*X-4801-204-0	TERMINAL ASSY
4	1-562-222-21	RECEPTACLE, CONNECTOR 6P
5	1-562-382-00	CONNECTOR, BNC
6	1-563-929-11	CONNECTOR, ROUND TYPE (RF) 4P
7	1-574-266-21	CABLE ASSY (17 CORE)
8	3-699-048-01	CAP, MOUNT
9	3-726-901-01	SCREW, TRIPOD

**NOTE:**

1. The shaded and  -marked components are critical to safety. Replace only with same components as specified.
2. Items marked "•" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
3. Item with no part number and/or description are not stocked because they are seldom required for routine service.

## 7-1-2. Camera Control Unit

No. Parts No. Description

51 \*A-7513-953-B COMPLETE PCB (INST), SG-150P  
 52 \*A-7513-816-A COMPLETE PCB, PR-99P

 71 3-661-624-00 SHEET (W), BLIND  
 72 3-717-382-01 KNOB, LEVER SW

73 \*3-726-917-01 SPRING  
 74 \*3-726-919-01 PLATE, SW, LEVER  
 75 \*3-726-920-01 PACKING  
 76 3-726-930-01 GUIDE (RIGHT), SLIDE  
 77 3-726-931-01 GUIDE (LEFT), SLIDE

78 \*3-726-939-01 PANEL, REAR  
 79 3-726-944-01 RAIL, SLIDE  
 80 \*3-726-946-01 COVER

## NOTE:

- The shaded and -marked components are critical to safety. Replace only with same components as specified.
- Items marked "\*" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Item with no part number and/or description are not stocked because they are seldom required for routine service.

## 7-2. ELECTRICAL PARTS LIST

- Safety Related Components Warning.

Components identified by  $\Delta$  marking on the schematic diagrams and repair parts list are critical to safe operation. Replace these components with Sony parts whose part numbers appear in this manual or in service bulletins and service manual supplements published by Sony.

- Replacement Parts supplied from Sony Parts Center will sometimes have a different shape from the original parts. This is due to "accommodating the improved parts and/or engineering changes" or "standardization of genuine parts." This manual's repair parts list indicate the parts numbers of "the standardized genuine parts at present." Regarding engineering parts changes in our engineering department refer to Sony service bulletins and service manual supplements.

- Items marked "o" in the SP column of the parts list are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.

- Abbreviations

Ref.No.	Description
C□□, CV□□	CAPACITOR
R□□, RV□□	RESISTOR

- Units for Capacitors, Inductors and Resistors.

The following units are assumed in schematic diagrams and repair parts list unless otherwise specified:

Capacitors:  $\mu$ F or pF

Inductors :  $\mu$ H

Resistors :  $\Omega$

- Parts that are not listed in the "Reference numbers order list" are shown in following list reference are omitted.

## CAPACITOR, CHIP CERAMIC

# CHAPTER 1

## OPERATION

### 1-1. OUTLINE

#### What is the title generator?

The title generator is a unit used to prepare title pictures (alphabet, figures and symbols) and to superimpose them on the pictures picked up by the camera. The video signal composed of the picture picked up by the camera and the picture prepared by the title generator are output from the camera control unit.

The title generator has the following features.

#### Up to 9 title pictures can be made and displayed

Up to 9 pages of title pictures can be made and numbered. The pictures can be sent in order of page numbers or in any desired order. It is also possible to send them out in an order designated in advance (program page). Scrolling the characters upward on the screen is also possible (roll page).

#### Variation of displays

Color and size of the characters can be designated page by page, and effects such as border, background color and blinking can be added to the characters. Color and blinking conditions can be designated character by character, and the size, border and background can be designated page by page.

#### Displaying the time, lap time and arrow mark

The time or lap time can be superimposed on the camera picture and title picture. The arrow mark can also be displayed, which can be moved up, down, right and left for indicating specific points on the screen.

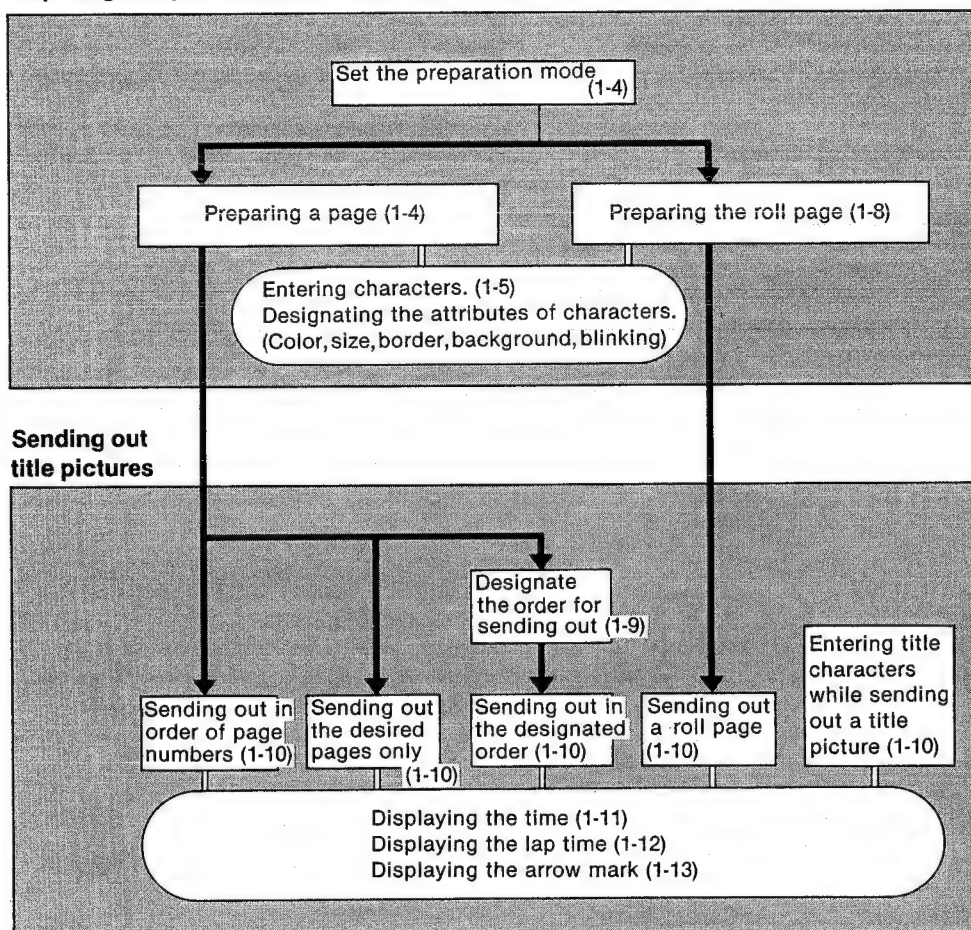

## Flow Chart of Preparing and Sending out Title Pictures

For details, please refer to the page indicated by the parentheses.

### Preparing title pictures

## 1-2. POWER SOURCES

### Power Supply

The power supply to the title generator is turned on and off by the camera.

#### Turning the power on

- 1** Check that the title generator, monitor and other equipment are correctly connected to the camera.
- 2** Turn the power of the camera and other equipment on.
- 3** To send out the title picture, see "Sending out the title pictures".  
To make title pictures, see "Preparing title pictures".

#### Note

First be sure to connect all equipment, then turn the power on.

The signal system (NTSC or PAL) of the title generator is automatically set according to the signal input from the camera, just after the power is turned on. Therefore, if the power is turned on before making the connection, correct signal system may not be set.

#### Turning the power off

**Turn the power of the camera off.**

Even if the power is turned off, title pictures, sending order and the settings of the time will be kept for about one month.

### Note on the back-up battery

The title pictures are stored in memory. The title generator has a rechargeable back-up battery of nickel cadmium to keep the title pictures and time in memory. When the battery is fully charged, the content of memory is kept for about one month after the power is turned off. When the battery is discharged, the time becomes incorrect and the memorized title pictures are erased.

**When the title generator is used for the first time, the battery may be discharged. Therefore, connect the title generator to the camera, turn the power on, and keep the power supply on for about 12 hours.** While charging of the battery, the camera and title generator can be used.

### 1-3. PREPARING TITLE PICTURES

Prepare a title picture, designate the number for each picture (this is called the page number), and store it. A title picture moving upward on the screen (roll page) can also be made.

#### Setting the Unit in Preparation Mode

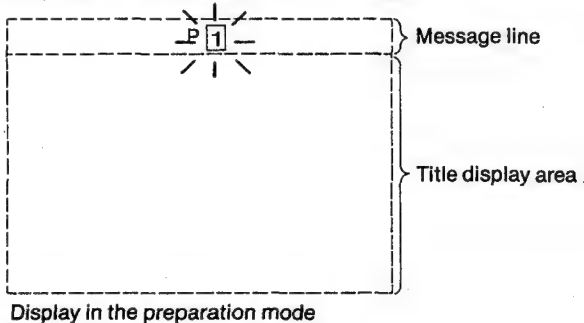

When the power is turned on, only the picture picked up by the camera is displayed on the monitor screen.

**To set the unit in the mode for making a title picture (preparation mode), press the **EDIT** key.**

On the monitor screen, page number "P1" is displayed and blinks. Then you can designate the page number and make the title picture.

##### Composition of the screen

The monitor screen displayed by the title generator is composed of the message line and a title display area. On the message line, the time or the lap time can be superimposed on the picture picked up by the camera. When making a title picture, a message to help making a title picture is displayed on the message line.

#### Preparing a Page

- 1 When the page number is blinking, designate the page number which is to be used.**  
Press one of the figure keys ① to ⑨ to change the "P1" (page number display) to the desired number. For example, to designate page 3, press the ③ key.
- 2 Press the **PAGE** key.**  
A sample character "E" and the designated page number are displayed.

Example when page 3 is designated.

- 3 Enter the title.**  
(For the method to enter characters, refer to "How to enter characters" in the next page.)
- 4 When the title picture has been made, press the **PAGE** key again.**  
"P3 SAVE? (Y/N)" is displayed after page 3 has been made.
- 5 To save the page, press the **Y** key.**  
The page is saved, and can be sent repeatedly.  
**If you do not want to save the page, press the **N** key.**  
The page is not saved and it cannot be sent out. The title picture made before remains in memory.

The title picture remains on the screen, and the page number starts blinking.  
Repeat steps 1 through 5 to make other pages.

## How to Enter Characters

Designation of the attributes of characters (color, size, etc.), entering the characters and modification of the entered characters are described here.

### Designating the attributes of characters

When the page is designated and displayed, designate the attributes of the characters. The attributes which can be designated are color, blinking condition, border, background and size. The background, border and size are designated page by page, and the color and blinking conditions can be designated character by character.

- **Designating border, background and size**  
Press the **EDGE** (border), **BGND** (background) or **SIZE** keys repeatedly until the desired conditions are obtained.

The designated conditions are checked with the sample character "E", except for the size, which is checked by the size of the cursor.

Then enter the characters so that they are displayed with the designated attributes.

When the attributes are designated after entering the characters, they are also changed.

- **Designating color and blinking condition**  
Press the **COLOR** or **BLINK** key repeatedly until the desired conditions are obtained.  
The designated condition are checked with the sample character.  
Then enter the characters so that they are displayed with the designated color and blinking condition.  
**The color and blinking condition can be changed at the desired position.**

- **Changing color and blinking condition of the characters which have been entered**

- 1 Press the **←**, **→**, **↑**, or **↓** key to place the cursor at the character whose color or blinking condition shall be changed.
- 2 Press the **COLOR** or **BLINK** key until the desired conditions are obtained.
- 3 Press the **ENT** key.  
The color and blinking conditions of the character are changed to the designated ones.

- **Displaying background color without a character**

When the **BGND** key is pressed, background color is added to the entered characters. To display only the background color, press the **ENT** key, and the background color will be displayed in the same size as the cursor without a character.

Entered by pressing the **ENT** key.

### Conditions designated by the attribute keys

Key	Attribute	Conditions	Minimum unit
<b>COLOR</b>	color	White*, black, red, green, yellow, blue, magenta, cyan	1 character
<b>BLINK</b>	Blinking	Not blinking*, Blinking	1 character
<b>EDGE</b>	Border	No border*, black, red, green, yellow, blue, magenta, cyan, white	1 picture
<b>BGND</b>	Back-ground	No background*, black, red, green, yellow, blue, magenta, cyan	1 picture
<b>SIZE</b>	Size	1x1 (standard)*, 2x1, 1x2, 2x2, 3x2, 2x3, 3x3	1 picture

### Notes

- \* mark shows the initial settings.
- When the background is designated, the border will automatically be black.
- If the **BGND** key is pressed to add background to the character with a border, the border is removed. To add the border to the character with background added, press the **EDGE** key again.

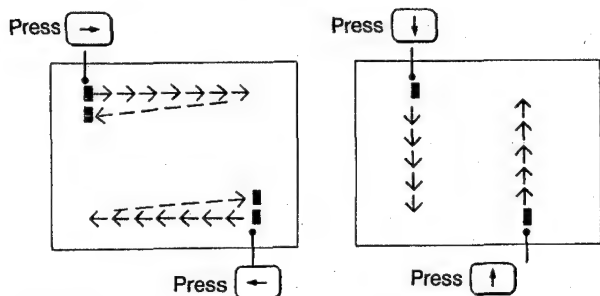

## Entering characters

Designate and display the page, and a sample character "E" will be displayed at the left top of the screen. A cursor appears to indicate the position where a character is entered at the top of the title display area.

### • Deciding the position for entering a character

Press the  $\leftarrow$ ,  $\rightarrow$ ,  $\uparrow$ ,  $\downarrow$  key to place the cursor where a character is to be entered.

### • Starting a new line

When entering characters, a new line is automatically started when the end of the previous line has been reached.

**To start a new line when you have reached the middle of the line, press the  $\downarrow$  and  $\leftarrow$  keys. Pressing the  $\text{ENT}$  key does not start a new line.**

### • Changing capital letters to small letters (figures to symbols) and vice versa

When the power is turned on, capital letters and figures are entered by pressing the character and figure keys. At this time, "E" is displayed, as a sample character.

**To enter small letters or symbols, press the  $\text{SHIFT}$  key, and the sample character changes to "e". To enter the capital letters, press the  $\text{SHIFT}$  key again.**

Keys pressed	(A)	(3#)	(/?)
Characters when sample character "E" is displayed	A	3	/
Characters when sample character "e" is displayed	a	#	?

### • Entering a space

Press the  $\text{SPC}$  key.

Place the cursor on an entered character and press the  $\text{SPC}$  key, and the character is deleted and a space is entered.

### Character size and the number of characters on a picture

Seven sizes of characters can be selected, and the number of characters displayed on a picture depend on the character size.

Character size Horizontal and vertical ratio against the standard size	Number of characters on the picture Horizontal x Vertical (characters) (lines)	
	NTSC	PAL
Standard size: 1x1	24x9	24x9
2x1	12x9	12x9
1x2	24x5	24x6
2x2	12x5	12x6
3x2	8x5	8x6
2x3	12x3	12x4
3x3	8x3	8x4

## Modifying the entered characters

### • Replacing the entered characters

Press either of the , ,  and  keys to place the cursor on the character which is to be replaced, and enter a new character.

The character where the cursor is placed changes to a new character.

### • Inserting or deleting a character and a line

- 1 Press the , ,  or  key to place the cursor on the character which is to be deleted, or to the position where a character is to be inserted.  
To designate a line, place the cursor at any position on the line.

- 2 Press the **INS/DEL** key.  
"I/D" is displayed.

- 3 To insert a space:  
Press the  key.

ABCDE → AB CDE

To delete a character  
Press the  key.

ABCDE → ABDE

To insert a line,  
Press the  key.

ABCDE ABCDE  
VWXYZ →  
VWXYZ

To delete a line,  
Press the  key.

ABCDE ABCDE  
VWXYZ → 1 2 3 4 5  
1 2 3 4 5

To insert characters,  
Press the  key so many times as the inserted characters, and enter characters.

ABCD → AB CD  
① ②  
→ AB12CD

- 4 When the insertion or deletion is finished, press the **INS/DEL** key again.

### When characters are pushed out of the screen

When characters are pushed out to the right end by inserting other characters, up to 5 characters in minimum character size can be memorized. When characters are pushed out below the screen, up to 3 lines in minimum character size can also be memorized. When the characters displayed on the screen are deleted, the memorized characters are displayed again on the screen.

### • Moving the whole title upward

Press the  key to move the cursor to the uppermost position (just below the message line) in the title display area, and press the  key again.

The title and the message line move upward by 1/4 line every time the key is pressed within the range of displaying the whole data without pushing them out of the screen.

### • Moving the whole title downward

Press the  key to move the cursor to the lowermost position in the title display area, and press the  key again.

The title and the message line move downward by 1/4 line every time the key is pressed within the range of displaying the whole data without pushing them out of the screen.

## Preparing a Title Picture Moving Upward (Roll Page)

Besides ordinary title pictures, a title picture moving upward on the screen (roll page) can be made. On a roll page, the data of the amount equivalent to three pages of an ordinary title picture (27 lines) can be entered.

- 1** Press the **[EDIT]** key to make the page number blink.
- 2** Press the **[ROLL]** key.  
"ROLL" is displayed, and the contents of the roll page appears.
- 3** Designate the attributes of the characters, and enter the title characters.  
(For details, refer to "How to enter characters".)  
When characters are entered to the bottom of the screen, continue entering characters, and the following line will automatically appear until characters for 3 pages are entered.  
To display the next line without entering characters, press the **[↓]** key.  
When the cursor is moved to the top of the displayed area and the **[↑]** key is pressed, the previous line will be displayed.
- 4** When the roll page has been made, press the **[ROLL]** key again.  
"ROLL SAVE? (Y/N)" is displayed.
- 5** To save the roll page, press the **[Y]** key, and the page is saved and can be sent repeatedly.  
If you do not want to save the page, press the **[N]** key, and the page will not be saved nor sent. The contents entered before remains in memory.

The display in the title display area remains as it is, and the page number starts blinking.

## Deleting a Prepared Page

- 1** Press the **[EDIT]** key to make the page number blink.
- 2** Press the figure key and the **[PAGE]** key to display the page that is to be deleted.  
To delete a roll page, press the **[ROLL]** key.
- 3** Press the **[CL]** key.  
"Px (or ROLL) CLEAR? (Y/N)" is displayed.  
(X shows the designated page number)
- 4** To delete the page, press the **[Y]** key.  
The title picture is deleted from the screen and from the memory.  
"CLR Px (or ROLL)" is displayed, and the page is ready to accept new data.  
The attributes of the characters are automatically set to the initial settings.  
If you do not want to delete the page, press the **[N]** key.  
The conditions when the page is displayed is retrieved.

## 1-4. SENDING OUT THE TITLE PICTURE

While monitoring the picture picked up by the camera on the monitor screen, designate the title page to be sent out. The following four methods are prepared for sending title pictures out.

- Sending them out in the order of page numbers
- Sending out the desired pages
- Designating the order of sending, and sending them out in the designated order (program page)
- Sending out the title moving upward (roll page)

### Designating the Order for Sending Out (program page)

To send the desired pages in the desired order, designate the order and memorize it in advance. The maximum number of pages that can be designated is 10. It is possible to designate a page repeatedly. One page sequence can be memorized. When a new order is designated, the order designated before is automatically erased.

- 1 Press the **[EDIT]** key to make the page number blink.**
- 2 Press the **[P.PAGE]** (Program PAGE) key.**  
"PGM" is displayed .  
When the order has been designated, the designated page numbers are displayed after "PGM".
- 3 To delete the displayed page numbers, press the **[←]** key repeatedly, and the page numbers will be erased from the last one.**
- 4 Designate the page numbers in the order they are sent out by pressing the figure keys (from ① to ⑨).**  
The page numbers are displayed after the "PGM".

Example when pages 2, 5 and 9 are designated.

#### Changing the page number

Press the **[←]** key to erase the designated number from the last page, and enter new page numbers.

- 5 When the designation is finished, press the **[P.PAGE]** key again.**  
The designated order is stored, and the page number starts blinking.

### Setting the Sending Mode

When the power is turned on, only the picture picked up by the camera is displayed on the monitor screen, and the title picture can be sent out.

If the page number "Px" is blinking on the message line, the mode for making a title picture is set. Press the **[EDIT]** button, and the sending mode is obtained. If a title page is still displayed after pressing the **[EDIT]** key, press the **[CL]** key to erase the title picture.

## Sending the Title Pictures

Press one of the following keys at the point where a title picture is to be sent out.

- **To send out in the order of page numbers, press the **[PAGE]** key.**

Page 1 is sent out. Every time the **[PAGE]** key is pressed, the consecutive page is sent out. When page 9 is sent out, pressing the **[PAGE]** key will send out page 1.

- **To send out desired pages, press the figure key (① – ⑨) corresponding to the page number.**
- **To send out in the designated order, press the **[P.PAGE]** key.**

Every time the key is pressed, the pages are sent out in the designated order.

- **To send out a roll page, press the **[ROLL]** key.**  
To stop sending a roll page, press the **[ROLL]** key again. To re-start sending it, press the **[ROLL]** key.

### Note

When the roll page is being sent, no key other than the **[PAGE]**, **[P.PAGE]**, **[ROLL]**, figure (① to ⑨) and **[CL]** keys can work. To use the other keys, interrupt sending of the roll page by pressing the **[CL]** key.

### To interrupt sending of the title picture

Press the **[CL]** key.

The title picture disappears from the screen.

When the time, lap time or arrow mark is displayed, it does not disappear. (Refer to "Displaying data other than the title".)

After pressing the **[CL]** key, press one of the above mentioned keys (**[PAGE]**, **[P.PAGE]**, **[ROLL]**, (① – ⑨)), and the page following the page last sent is sent out.

### Combination of 4 methods

While sending a title picture, the sending method can be changed.

- **To start sending the page following the page being sent,**  
Press the **[PAGE]** key.
- **To send title pictures in the designated order regardless of the page being sent,**  
Press the **[P.PAGE]** key.
- **To send a roll page,**  
Press the **[ROLL]** key. The roll page can be sent without affecting the designated order.

Example:

## Entering Characters While Sending a Title Picture (Type)

While sending a title picture or displaying a picture picked up by the camera, the title picture can be modified or a new title picture can be made.

- 1 While sending a title picture or displaying a picture picked up by the camera, press the **[TYPE]** key.**  
A cursor appears on the left top of the screen, and a title can be entered.
- 2 Decide the attributes of the characters, and enter the characters.** (Refer to "How to enter characters".)  
The entered characters are directly sent out. The attributes of the characters can be checked with the cursor instead of the sample character. Changing of capital letters to small letters or vice versa, or insertion or deletion of a character or a line cannot be checked because a message cannot be displayed.
- 3 When the input is finished, press the **[TYPE]** key again.**  
The cursor disappears, but the display remains as it is.

Press the **[CL]** key to interrupt sending of a title picture, or press the **[PAGE]**, **[P.PAGE]**, **[ROLL]** or figure key to send another page. The characters entered after pressing the **[TYPE]** key are not stored, and therefore they cannot be sent repeatedly. Even if the characters being sent are modified after pressing the **[TYPE]** key, the characters that have not been modified remain in memory.

## 1-5. DISPLAYING DATA OTHER THAN THE TITLE PICTURE

While sending the title picture or displaying a picture picked up by the camera, the time or lap time can be displayed. An arrow mark can also be displayed to indicate a desired point on the screen.

The time and the lap time are displayed at the top of the screen (message line).

### Example of the time display

### Example of the lap time display

Time setting and display format setting, comment input, color and blinking condition of characters are designated in the preparation mode. Only the standard size characters are displayed, and the border and background designations are the same as those of the title characters being sent out.

## Time Display

### Displaying the time

While sending title pictures or displaying a picture picked up by the camera, press the **CLOCK** key. If the **CL** key is pressed to interrupt sending of the title picture, the time display remains.

To delete the time display, press the **CLOCK** key again.

### Note

While sending the roll page, the **CLOCK** key does not work.

### Setting the time

The time is displayed based on the built-in clock. Set the clock to the correct time when the title generator is used for the first time.

- 1 When the page number is blinking in the preparation mode, or the contents of a page is displayed, press the **CLOCK** key. The current time is displayed.

When the 24-hour display mode is selected, "\*" is displayed instead of "PM".

The cursor is placed at the beginning position of the comment column.

- 2 Enter a comment if necessary. The color and blinking condition of the comment can be designated by the **COLOR** and **BLINK** keys.
- 3 Press the **START/STOP** key. The cursor moves to the position "PM", and the displayed clock data stops. In this condition, the clock can be set.

#### 4 To change the time display mode (12-hour display/24-hour display),

Move the cursor to the position "PM" or "\*", and press the **[↑]** key.

Every time the key is pressed, the display is changed as follows;

12-hour display → 12-hour display (without second) → 24-hour display → 24-hour display (without second) ....

When the **[↑]** key is pressed, the displayed mode is changed in the reversed order.

#### Setting the clock

Move the cursor to the position of the hours or minutes whose figures are to be changed, and press the **[↑]** or **[↓]** key to change the figures.

When the figures of hours or minutes are changed, the figures for seconds are automatically changed to "00". If the **[START/STOP]** key is pressed before changing the figures of hours and seconds, the clock returns to the condition in step 2.

#### Changing the color and blinking condition of the time display

- (1) Place the cursor to the character whose condition is to be changed.
- (2) Press the **[COLOR]** and **[BLINK]** keys until the sample character "E" is set to the desired condition.
- (3) Press the **[ENT]** key to change the color and blinking condition of the character where the cursor is placed.

#### 5 Press the **[START/STOP]** key to start the clock, setting it to the time signal from the radio or others.

#### 6 When the time is set, press the **[CLOCK]** key again. The preparation mode is retrieved.

## Lap Time Display

### Displaying the lap time

- 1** While sending title picture or displaying a picture picked up by the camera, press the **[LAP]** key. "LAP 00:00:00" is displayed. If the **[CL]** key is pressed to stop the title display, the lap time display remains.
- 2** Press the **[START/STOP]** key at the point from where the lap time is to be counted. The lap time is counted in the unit of 1/10 second.
- 3** To check the lap time, press the **[START/STOP]** key again. The displayed clock data stops, but the clock operation continues.
- 4** Press the **[START/STOP]** key, and the clock data is retrieved. Repeat steps 3 and 4 to check the lap time.
- 5** To terminate the lap time display, press the **[LAP]** key. If the **[LAP]** key is pressed again, the lap time is reset to 0.

#### Notes

- While sending the roll page, the **[LAP]** and **[START/STOP]** keys do not work.
- If a new page is sent out while counting the lap time, the figure in the 1/10 second block momentarily stops, but the counting continues normally.

### Changing color and blinking condition of the lap time display, or entering a comment

- 1 Press the **EDIT** key to set the preparation mode, and press the **LAP** key.  
The lap time is displayed.

- 2 Place the cursor at the character whose color and blinking condition shall be changed.
- 3 Press the **COLOR** or **BLINK** key until sample character "E" is set to the desired conditions.
- 4 Press the **ENT** key, and the color and blinking condition of the character where the cursor is placed change.
- 5 Enter a comment if necessary (maximum 10 characters).
- 6 When the setting is finished, press the **LAP** key again.

### Arrow Mark Display

#### Displaying the arrow mark

- 1 While sending title picture or displaying a picture picked up by the camera, press the **⇐** key.  
An arrow mark is displayed on the screen.  
If the arrow mark and the title are overlapped, the arrow mark is displayed on the title.  
If the **CL** key is pressed to stop sending of the title picture, the arrow mark remains displayed.
- 2 Press the **⇐**, **⇒**, **↑**, or **↓** key to move the arrow mark to the desired position.
- 3 To change the direction of the arrow head, press the **SHIFT** key, and press the cursor key which indicates the desired direction.  
To retrieve the condition under which the arrow mark can be moved, press the **SHIFT** key again.
- 4 To terminate the arrow mark display, press the **⇐** key again.

#### Changing the attributes (color, background, border, size and blinking) of the arrow mark

When the arrow mark is displayed while sending a title picture, press the attribute keys (**COLOR**, **BGND**, **EDGE**, **SIZE** or **BLINK**).

While making the title picture, the arrow mark can be displayed to check its current conditions. However the direction of the arrow head or the attributes of the arrow mark cannot be changed.

#### Note

While sending the roll page, the arrow mark cannot be displayed. When the arrow mark has already been displayed, the conditions of the displayed arrow mark cannot be changed.

## 1-6. LOCATION AND FUNCTION OF KEYS

### Location of Keys

### Guide of the Key Operation

#### For preparing title pictures

Functions	Operating procedures (□, and ○ shows the keys to be pressed)
To set the mode for preparing a title page	Turn the power on (sending mode). → <b>EDIT</b>
Displaying a page and preparing a title picture	Preparation mode → ① - ⑨ → <b>PAGE</b> → Entering characters → <b>PAGE</b> → <b>Y</b> (to store) [or <b>N</b> (not to store)]
Displaying a roll page and preparing a title picture	Preparation mode → <b>ROLL</b> → Entering characters → <b>ROLL</b> → <b>Y</b> (to store) [or <b>N</b> (not to store)]
Deleting a page	Displaying a page (or a roll page) → <b>CL</b> → <b>Y</b> (delete) [or <b>N</b> (not delete)]

#### Sending out title pictures

Functions	Operating procedures
Designating the order of pages to be sent out	Preparation mode → <b>P.PAGE</b> → ① - ⑨ → <b>P.PAGE</b>
Set the sending mode	Turn the power on. Or set the preparation mode. → <b>EDIT</b>
Sending out title picture in order of the page numbers	Sending mode → <b>PAGE</b>
Sending out the desired pages	Sending mode → ① - ⑨
Sending out title picture in the designated order	Sending mode → <b>P.PAGE</b>
Sending a roll page	Sending mode → <b>ROLL</b>
Interrupting sending of a title picture	Sending out a title picture → <b>CL</b>
Entering characters while sending out a title picture	Sending mode → <b>TYPE</b> → Entering characters → <b>TYPE</b>

## Entering characters

Functions	Operating procedures
Designating the attributes of characters	
• Designating the size	<b>SIZE</b>
• Designating the background	<b>BGND</b>
• Designating the border	<b>EDGE</b>
• Designating the blinking condition	<b>BLINK</b>
• Designating the color	<b>COLOR</b>
Deciding a position to enter characters by moving a cursor	← → ↑ ↓
Changing capital letters to small letters and vice versa	<b>SHIFT</b> (capital) ↔ <b>SHIFT</b> (small)
Entering a space	<b>SPC</b>
Inserting or deleting a character or a line	<b>INS/DEL</b>
• Inserting a space	→
• Deleting a character	←
• Inserting a line	↓
• Deleting a line	↑
Changing the color or blinking condition	Move the cursor at the character whose color or blinking condition is changed. → <b>COLOR</b> or <b>BLINK</b> → <b>ENT</b>

## Other functions

Functions	Operating procedures
Displaying the time	Sending mode → <b>CLOCK</b> → <b>CLOCK</b> (quit)
Setting the time	Preparation mode → <b>CLOCK</b> → <b>START/STOP</b> → Place the cursor at the item whose data is changed → Change the character or figure by pressing the ↑ or ↓ → <b>START/STOP</b> → <b>CLOCK</b>
Displaying the lap time → Starting counting → Displaying the lap time and stopping the clock data display	Sending mode → <b>LAP</b> → <b>START/STOP</b> → <b>LAP</b> (quit)
Changing the lap time display condition	Preparation mode → <b>LAP</b> → Place the cursor at the position whose character is changed. → <b>COLOR</b> or <b>BLINK</b> → <b>ENT</b> → <b>LAP</b>
Displaying an arrow mark	Sending mode → → → (quit)
Moving an arrow mark	Displaying the arrow mark → → ↑ ↓
Changing the direction of the arrow head	Displaying the arrow mark → <b>SHIFT</b> → → ↑ ↓ → <b>SHIFT</b> (quit)
Producing a sound when a key is touched	♪ → ♪ (quit)

### Producing a Key Touch Sound

The unit can be set so that a sound can be heard every time a key is touched.

In the initial settings, a sound cannot be heard.

**To produce a key touch sound, press the ♪ key.**

When the ♪ key is pressed again, the sound cannot be heard even if a key is touched.

not including the connection cable  
Approx. 300g (11oz)

Weight

#### 2-2. PRECAUTIONS ON REPAIR

Always unlock the connector when disconnecting the sheet switch. To release the lock, pull the connector in the arrow direction as shown.

(Pulling the connector in lock state can damage the carbon in lead section.)

### 2-3. BATTERY REPLACEMENT

A Ni-Cd battery is built in the unit to back up the memory. When the clock malfunctions or the contents of memory are cleared, charge the battery (for about 10 hours). Replace it if symptom cannot be remedied.

Connect the unit and camera, and replace the battery with the power switch on the camera turned ON, when the contents of memory are to be stored. Note that replacing the battery without connecting the unit to the camera clears all data in the memory.

#### Replacing procedure:

- 1) Disconnect the used battery, starting from positive (+) terminal.
- 2) Bend the lead of a new battery as shown in Figure 1, and install it on the specified position of the board, starting from negative (-) terminal.
- 3) As shown in Figure 2, place the board on upper cabinet and solder leads with battery height aligned with the groove.

Fig.1

Fig.2

## CHAPTER 3

### THEORY OF OPERATION

Serial No.	
TGR-750 (E)	40,001~40,100
TGR-007	10,001~10,150

#### 3-1. POWER SUPPLY

This unit is powered from the camera, and it contains a rechargeable Ni-Cd battery to back up the memory (SRAM: IC59) and LSI for clock (IC62). The Ni-Cd battery is charged when the unit is connected to the camera and the power is supplied. Two voltage detectors (IC2, 3) are connected in serial to take the power on-off timing.

#### 3-2. SYNCHRONIZING-PULSE SEPARATION

The composite signals sent from the camera are entered in the buffer (Q2) once. Then, their phases are inverted and they are amplified by the Q1. Next, noise is removed by D50 and IC51. Then, synchronizing pulses are separated by IC52 and 53, and sent to the CPU (IC6) and character generator (IC4, 5) to take timing with camera.

#### 3-3. CHARACTER GENERATOR

Signals generated by the character generator (IC4, 5) pass through the priority circuit (IC57, 60) where the pointer signal generated by IC4 takes precedence, and they are sent to the camera side after RGB composition by IC58.

M50455-079/080FP (IC5, 4)

LSI to control character and pattern display on the TV screen

## CHAPTER 4 ADJUSTMENT

### 4-1. POSITIONING

(Perform the following adjustment when the cursor display range runs out the monitor screen, or it is extremely narrow, or when CV2, L2, C14, IC5, or CV1, L1, C13, IC4 [CV2, L2, C71, IC4, or CV1, L1, C10, IC3] is replaced.)

#### Preparation:

Oscilloscope	Band 100MHz minimum or 2ch minimum
Adjusting tool	Insulated screwdriver
Camera	DXC-750, etc.
Monitor	RGB or COMPOSITE VIDEO input provided

#### Connection:

Connect camera and monitor.

Connect TGR and camera.

#### 4-1-1. Screen Positioning

##### Procedure:

- 1) Turn on the power switch on the camera.
- 2) Press the TYPE key. (The cursor appears.)
- 3) Keep pressing the BGND key to select a red background.

- 4) Press the ENT key. (The cursor moves by one character.)

MONITOR PICTURE

- 5) Press the TYPE key in step 4) state so that the cursor disappears.

MONITOR PICTURE

- 6) Connect CH1 on the oscilloscope with TP16 (D, R) [TP18 (D, R)], and CH2 with TP2 (H.SYNC) [TP9 (H.SYNC)]. (Trigger CH1, +)
- 7) Adjust the CV2 (trimmer) by turning it with a screw-driver so that the following value can be obtained.

#### 4-1-2. Pointer Positioning

##### Procedure :

- 1 ) Turn on the power switch on the camera.
- 2 ) Press the  key so that the pointer ( arrow ) appears.
- 3 ) Keep pressing the  key to select a red background.

- 4 ) Press the  key and make the pointer (arrow) 2x2 size as shown in Fig.

1X1

1X2

2X1

2X2

- 5 ) Keep pressing the  key until the pointer is locked at the right end.

MONITOR PICTURE

- 6 ) Connect CH1 on the oscilloscope with TP16 ( D, R ) ( TP18( D,R ) ) ,and CH2 with TP2( H.SYNC ) ( TP9 ( H.SYNC ) ) . (Trigger CH1, )
- 7 ) Adjust the CV1 (trimmer) by turning it with a screwdriver so that following value can be obtained.

## 4-2. ADJUSTING TIMER OSCILLATING FREQUENCY

(Perform the following adjustment when clock malfunctions, or X2, C26, IC62 or CV3 [X2, C79, IC7 or CV3] is replaced.)

### Preparation:

Frequency counter	Significant figure 8 digits minimum
Adjusting tool	Insulated screwdriver
Camera	DXC-750, etc.
Monitor	RGB or COMPOSITE VIDEO input provided

### Connection:

Same as that in positioning.

### Procedure:

- 1) Turn on the power switch on the camera.
- 2) Press the CLOCK key to display the clock, and make sure that it is running.
- 3) Connect the probe of the frequency counter with TP20 (CLOCK) [TP7 (CLOCK)], and GND with negative (-) terminal of battery.
- 4) Adjust the CV3 (trimmer) by turning it with a screwdriver so that the frequency counter indicates the following value.

4096.00  $\pm$  0.01 Hz

Gate time: 1 sec

## 注意:

1. DC電圧はデジタル電圧計(入力インピーダンス10MΩ)による値。

2. 波形写真及びDC電圧は下記条件で測定。

## ・フロントパネル

COLOR TEMP : 3200K  
 W/B BALANCE AUTO/MAN : AUTO  
 GAIN : 0dB  
 MASTER PED : 中央位置  
 IRIS AUTO/MAN : AUTO  
 GAIN : 0dB  
 SHUTTER ON/OFF : OFF  
 MODE : CAM  
 DETAIL : 中央位置  
 PHASE SC 0/180 : 0

## ・リアパネル

GAMMA : ON  
 LINEAR MATRIX : ON

## ・カラーバーを撮影

YEL	CYAN	GRN	WHT	MAG	RED	BLUE
-----	------	-----	-----	-----	-----	------

## NOTE:

1. All voltage are dc, measured with a digital voltmeter. (input impedance: 10MΩ)

2. All waveforms are taken and DC voltage is measured in condition below.

## ・FRONT PANEL

COLOR TEMP : 3200K  
 W/B BALANCE AUTO/MAN : AUTO  
 GAIN : 0dB  
 MASTER PED : mechanical center  
 IRIS AUTO/MAN : AUTO  
 GAIN : 0dB  
 SHUTTER ON/OFF : OFF  
 MODE : CAM  
 DETAIL : mechanical center  
 PHASE SC 0/180 : 0

## ・REAR PANEL

GAMMA : ON  
 LINEAR MATRIX : ON

## ・Shoot the color bar chart

YEL	CYAN	GRN	WHT	MAG	RED	BLUE
-----	------	-----	-----	-----	-----	------

注意：

- DC電圧はデジタル電圧計(入力インピーダンス10MΩ)による値。
- 波形写真及びDC電圧は下記条件で測定。

・フロントパネル

COLOR TEMP : 3200K  
W/B BALANCE AUTO/MAN : AUTO  
GAIN : 0dB  
MASTER PED : 中央位置  
IRIS AUTO/MAN : AUTO  
GAIN : 0dB  
SHUTTER ON/OFF : OFF  
MODE : CAM  
DETAIL : 中央位置  
PHASE SC 0/180 : 0

・リアパネル

GAMMA : ON  
LINEAR MATRIX : ON

・カラーバーを撮影

YEL	CYAN	GRN	WHT	MAG	RED	BLUE
-----	------	-----	-----	-----	-----	------

NOTE :

- All voltage are dc, measured with a digital voltmeter. (input impedance: 10MΩ)
- All waveforms are taken and DC voltage is measured in condition below.

・FRONT PANEL

COLOR TEMP : 3200K  
W/B BALANCE AUTO/MAN : AUTO  
GAIN : 0dB  
MASTER PED : mechanical center  
IRIS AUTO/MAN : AUTO  
GAIN : 0dB  
SHUTTER ON/OFF : OFF  
MODE : CAM  
DETAIL : mechanical center  
PHASE SC 0/180 : 0

・REAR PANEL

GAMMA : ON  
LINEAR MATRIX : ON

・Shoot the color bar chart

YEL	CYAN	GRN	WHT	MAG	RED	BLUE
-----	------	-----	-----	-----	-----	------

注意：

- 1. DC電圧はデジタル電圧計(入力インピーダンス10MΩ)による値。
- 2. 波形写真及びDC電圧は下記条件で測定。

・フロントパネル

COLOR TEMP : 3200K

NOTE :

- 1. All voltage are dc, measured with a digital voltmeter. (input impedance: 10MΩ)
- 2. All waveforms are taken and DC voltage is measured in condition below.

CHAPTER 7

REPAIR PARTS

7-1. MECHANICAL PARTS LIST

7-1-1. Camera Head Unit

	Description
1	A-7501-057-A CHU ASSY, SERVICE
2	*X-3726-908-1 CABINET ASSY
3	*X-4801-204-0 TERMINAL ASSY
4	1-562-222-21 RECEPTACLE, CONNECTOR 6P
5	1-562-382-31 CONNECTOR, BNC
6	1-563-929-11 CONNECTOR, ROUND TYPE (RF) 4P
7	1-574-266-21 CABLE ASSY (17 CORE)
8	3-699-048-01 CAP, MOUNT
9	3-726-901-01 SCREW, TRIPOD

- NOTE:
1.

The shaded and -marked components are critical to safety. Replace only with same components as specified.

2.

Items marked "\*" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.

3.

Item with no part number and/or description are not stocked because they are seldom required for routine service.

## 7-1-2. Camera Control Unit

No. Parts No. Description

77	3-726-931-01	GUIDE (LEFT), SLIDE
78	*3-726-939-01	PANEL, REAR
79	3-726-944-01	RAIL, SLIDE
80	*3-726-946-01	COVER

### NOTE:

- The shaded and -marked components are critical to safety. Replace only with same components as specified.
- Items marked "\*" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Item with no part number and/or description are not stocked because they are seldom required for routine service.

## 7-2. ELECTRICAL PARTS LIST

- Safety Related Components Warning.  
Components identified by  $\Delta$  marking on the schematic diagrams and repair parts list are critical to safe operation. Replace these components with Sony parts whose part numbers appear in this manual or in service bulletins and service manual supplements published by Sony.
- Replacement Parts supplied from Sony Parts Center will sometimes have a different shape from the original parts. This is due to "accommodating the improved parts and/or engineering changes" or "standardization of genuine parts." This manual's repair parts list indicate the parts numbers of "the standardized genuine parts at present." Regarding engineering parts changes in our engineering department refer to Sony service bulletins and service manual supplements.
- Items marked "o" in the SP column of the parts list are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Abbreviations

Ref. No.	Description
C□□, CV□□ R□□, RV□□	CAPACITOR RESISTOR

- Units for Capacitors, Inductors and Resistors.  
The following units are assumed in schematic diagrams and repair parts list unless otherwise specified:  
Capacitors:  $\mu$ F or pF  
Inductors :  $\mu$ H  
Resistors :  $\Omega$
- Parts that are not listed in the "Reference numbers order list" are shown in following list reference are omitted.

### NOTE:

1. The shaded and -marked components are critical to safety. Replace only with same components as specified.

2. Items marked "\*" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
